**SECTION 3**
**LUBRICATION**

1. GENERAL .................................................. 3-1
2. TRANSMITTER DISTRIBUTOR ..................... 3-2 through 3-11
1. GENERAL

a. The adjustment of the Single-Shaft Transmitter Distributor is arranged in a sequence that should be followed if a complete readjustment of the unit were undertaken.

b. After an adjustment has been completed, be sure to tighten any nuts or screws that may have been loosened.

c. Tools and spring scales required to perform the adjustments are listed in Teletype Bulletin 11248, but are not supplied as a part of the equipment.

d. The adjusting illustrations, in addition to indicating the adjusting tolerances, positions of moving parts and spring tensions, also show the angle at which the scale should be applied when measuring spring tensions.

e. From time to time the requirements and procedures for the various adjustments may change. For this reason, the text of the adjustment in the latest issue should be read through before proceeding to make any readjustment.

f. If a part that is mounted on shims is removed, the number of shims used at each of its mounting screws should be noted so that the same shim pile-up may be replaced when the part is remounted.

g. If parts or assemblies are removed to facilitate readjustment and subsequently replaced, recheck any adjustment that may have been affected by the removal of these parts or assemblies.

h. The spring tensions given in this bulletin are indications (not exact values) and should be checked with proper spring scales in the position indicated. Springs which do not meet the requirement and for which no adjusting procedure is given should be replaced by a new spring.

NOTE

When rotating the main shaft by hand, the clutch does not fully DISENGAGE upon reaching its stop position. In order to relieve the drag on the clutch and permit the main shaft to rotate freely, apply pressure on a lug of the clutch disk with a screw driver to cause it to engage its latch lever and thus DISENGAGE the internal expansion clutch shoes from the clutch drum.

i. References made to left or right, up or down, front or rear etc. apply to the unit in its normal operating position as viewed from the operator's position opposite the end with the motor and terminal blocks.

j. When the requirement calls for the clutch to be DISENGAGED the clutch shoe lever must be fully latched between its trip lever and latch lever so that the clutch shoes release their tension on the clutch drum. When ENGAGED, the clutch shoe lever is unlatched and the clutch shoes are wedged firmly against the clutch drum.

k. All contact points should meet squarely. Contacts with the same diameter should not be out of alignment more than 25% of the contact diameter. Avoid sharp kinks or bends in the contact springs.

l. The covers may be removed for inspection and minor repair of the unit; however, when more extensive maintenance is to be undertaken, it is recommended that the unit be disconnected from its source of power as a safety precaution.

m. Should the rotor of the synchronous motor become blocked for several seconds by an overload, the thermal cut-out switch will de-energize the motor until the manual reset button is depressed. However, allow at least 5 minutes for the motor to cool before attempting to reset the switch and start the motor.

SECTION 2
DISASSEMBLY AND REASSEMBLY

1. GENERAL

The various covers may be removed for inspection, lubrication or minor repair of the unit; however, a complete adjustment will necessitate the removal of the transmitting distributing mechanism from its base. To facilitate adjustment, a generous length of cable is provided between the unit and its terminal block in order that the unit may be rotated or inverted. The AC or DC potential should be disconnected from its power source.

Care should be exercised when the unit is replaced to keep the cable free of any moving parts. For more detailed illustration of the assemblies referred to in the following text, see the Teletype Model 28 Transmitter Distributor (LXD) Parts Bulletin.

NOTE

Retaining rings (tru-arc) are of spring steel and have a tendency to release suddenly. Loss of these can be minimized as follows: Hold the ring with your left hand to prevent it from rotating. Place the blade of a suitable screwdriver in one of the slots of the ring. Rotate the screwdriver in a direction to increase the diameter of the ring. The retaining rings will come off easily without flying.

2. DISASSEMBLY AND REASSEMBLY

a. Motor Cover - To remove the cover that houses the motor unit, lift upward. Replace in reverse order.

b. Front (Snap) Panel

(1) To remove the front panel, pull outward on the lower right and left rear corner of the front panel and slide the panel toward the front.

(2) To replace the front panel, mate the slide on the frame and push toward the rear.

c. Cover Plate

(1) To remove the 156607 cover plate, lift the left end upward and slide the plate toward the left to disengage the spring clip. (See Figure 1-1)

(2) To replace the cover plate, reverse the procedure. (See page 1-9)

d. Top Plate

(1) To remove the 156606 top plate, loosen the front and rear mounting screw, see figure 1-1, and lift the plate upward.

(2) To replace the top plate, guide the mounting screws into the notch of the front and rear plate. Align the sensing pins and feed wheel with their respective slots. Refer to adjusting procedure page 1-9 if the plates do not align.

e. Tape Guide Plate

(1) To remove the 156550 tape guide plate, loosen the front and rear mounting screw and slide the plate upward. (See Figure 1-1)

(2) To replace the tape guide plate, guide the mounting screws into the respective notch of the front and rear plate while guiding the tape-out pin into its notch and locating the sensing pins against the left edge of the tape guide plate. Refer to page 1-8 and 1-9.

f. Oil Reservoir

(1) To remove the oil reservoir, remove the screws that secure the casting and lift the assembly upward and toward the right.

(2) To replace the oil reservoir, reverse the procedure. See Figure

g. Rear Plate Assembly

(1) Remove cable assembly leads from start-stop contact assembly and magnet assembly.

(2) Remove right rear and left front 112626 nuts (10-32) and 2669 lockwashers from bottom posts.

(3) Remove 156588 clamp.

(4) Remove 151630 screws securing plate to 156622 post.

(5) Remove the two 151630 screws which secure the 156541 clutch trip magnet to the rear plate and remove clutch trip magnet assembly.
(6) Remove rear plate assembly from the remainder of the unit.

(7) To replace, reverse the procedure.

h. Main Shaft Assembly

(1) Remove the 156631 clamp and 156632 plate from the front plate assembly.

(2) Remove the main shaft assembly.

(3) Replace in the reverse order.

i. Center Plate Assembly

(1) Remove the 156622 post.

(2) Remove the two nuts (6-40) which secure the center plate to the two guide posts.

(3) Remove the 7603 spring.

(4) Remove the center plate assembly.

(5) Replace in reverse order.

3. Mounting of Unit

a. The LXG1 unit mounts on the Model 28 Transmitter Distributor Base, LXDB 1

b. The LXG3 unit mounts on the base provided in the Automatic Send-Receive Set.

c. Place the unit on the front part of the base and secure screws furnished with the base in the three holes provided in the left and right mounting plates. Screws should be friction tight.

d. Position the unit from left to right so that there is barely perceptible gear play. Tighten the three mounting screws.
SECTION 3
LUBRICATION

1. GENERAL

1.01 The transmitter distributor should be lubricated before being stored or placed in service. After a few weeks of service, relubricate to make certain that all points of each mechanism receive lubrication. The following lubrication schedule should be followed thereafter:

<table>
<thead>
<tr>
<th>OPERATING SPEED</th>
<th>LUBRICATION INTERVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) 60 W.P.M.</td>
<td>3000 Hours or 1 Year *</td>
</tr>
<tr>
<td>(2) 75 W.P.M.</td>
<td>2400 Hours or 9 Months *</td>
</tr>
<tr>
<td>(3) 100 W.P.M.</td>
<td>1500 Hours or 6 Months *</td>
</tr>
</tbody>
</table>

* Whichever occurs first.

1.02 KS7470 oil should be used for the lubrication of all points where oil is specified. KS7471 grease should be used at all points where grease is specified. All felt lubricating washers and all moving surfaces should be thoroughly lubricated. However, over lubrication which would allow oil to drip or grease to be thrown on other parts should be avoided. Exercise the utmost care to avoid getting oil or grease on the face of any contact point or the magnet pole face.

1.03 Should the motor be disassembled at any time, repack the bearings with KS7471 grease.

1.04 On units that are powered from the motor located on the keyboard (Automatic Send-Receive Set), make sure that the driving gears are lubricated. A change of gears to accommodate a new speed should include lubrication.

1.05 The photographs show the paragraph numbers referring to a particular line drawings of mechanisms and where these mechanisms are located on the unit.

1.06 The illustration symbols indicate the following lubrication directions:

- 0 Apply 1 drop of oil.
- 02 Apply 2 drops of oil.
- 03 Apply 3 drops of oil.
- G Apply thin film of grease.
- SAT Saturate (Felt Washers, Wicks) with oil.
