LUBRICATION SUPPLIES
AND DIRECTIONS FOR USE

The following lubricants have been standardized for use on all types of Teletype apparatus:

<table>
<thead>
<tr>
<th>Code</th>
<th>Quantity/Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>88970</td>
<td>1 Qt. of KS-7470 Oil</td>
</tr>
<tr>
<td>88971</td>
<td>1 Gal. of KS-7470 Oil</td>
</tr>
<tr>
<td>88973</td>
<td>1 Lb. of KS-7471 Grease</td>
</tr>
<tr>
<td>88975</td>
<td>KS-8319 Grease Gun</td>
</tr>
<tr>
<td>97116</td>
<td>4-oz. Tube of KS-7471 Grease</td>
</tr>
</tbody>
</table>

The above grease is recommended instead of oil for lubricating motors equipped with ball bearings. The 88975 grease gun should be used for injecting grease into the bearings of Teletype ball bearing motors. The gun may be used also for applying grease to other parts of the apparatus and no other grease container need be carried. If this grease gun is not available, the oil listed in the foregoing should be substituted for lubricating ball bearing motors.

Instructions for Filling the Grease Gun

1. Unscrew the lubricant tube from the cap casting of the grease gun.

2. Insert fresh lubricant through the open end of the tube with the fingers. Apply gradually to eliminate air pockets.

3. Tamp the lubricant down solidly in the tube by pounding the closed end solidly against the palm of the hand. Continue to add lubricant until the tube is completely filled and the metal follower rests against the perforated tube cover.

4. Fill the cap casting with lubricant flush to the bottom side of the tube threads.

5. Screw the lubricant tube into the cap casting part way only. Then insert a pencil or rod through the perforated tube cover and exert pressure against the metal follower so as to expel any entrapped air past the tube threads. When lubricant begins to ooze through the threads, tighten the lubricant tube securely in the cap casting.

6. Operate the handle back and forth for several strokes or until lubricant is pumped from the nozzle. The gun is then ready for use. If the lubricant does not flow from the nozzle in a solid stream, it is an indication that all air has not been expelled from the lubricant tube. Invert the gun and pound the cap casting end against the palm of the hand to jar the lubricant into the pump cylinder.

Instructions for Lubricating Motor Ball Bearings

The motor bearings are packed with grease before the motor leaves the factory and under ordinary operating conditions need no additional lubrication for approximately two months. At the regular lubricating intervals one or two strokes of the plunger of the gun should apply sufficient grease to each bearing.
To lubricate, press the nozzle of the gun against the ball oiler and force the
grease into the hole by pushing on the plunger of the gun. Care should be taken
that the bearings are not overloaded. Overloading will result in the grease
oozing out of the end castings and being forced into the motor or being thrown
on other parts of the mechanism. After lubricating, the motor should be run for
a few minutes and then any excess grease that has been forced out of the ends of
the castings should be wiped off. Each time that the gun is used for lubricating
a motor bearing, the plunger should first be depressed slightly to make sure
that grease will be delivered.
