10 January 1951
Temporary Correction T-4 to Instruction Book for Frequency Shift Converter-Comparator

Groups AN/URA-6, AN/URA-7, and Frequency Shift Converter CV-57/URR NAVSHIPS 91355

1. In Figures 7-21 (on page 7-35, 7-36, and in envelope at end of book) and Figure 7-44 (page 7-79, 7-80), make the following revisions:
(a) Break the connection between R922 and R923, and connect the lower end of R922 to pin 1 of X906. Connect the open top end of R923 to pin 8 of X907.
(b) Break the connection of the arm on R923 to pin 8 of X906. Instead, connect the arm of R923 to ground.
(c) Change resistance values of R921, R946, R945, R922, from 4.7K, 47, 47,470 , to $68 \mathrm{~K}, 680,680,68 \mathrm{~K}$ respectively.
(d) Delete resistor R940, and connect P901-3 directly to junction of R910 and R911. Insert resistor R940 (10K) between P901-2 and X906-6.
2. In Figure 7-36 make the following revisions. Also make these revisions in Figures 19 and 20 (on pages 7-31 through 7-34, and in envelope at end of book).
(a) Reverse connections at pins 8 and 9 of switch s302. S302-8 should go to P3O1-4, and S302-9 should connect to arm of R318.
(b) Connect S302-7 to ground.
(c) Insert resistor R3O4 (100K) between P3OL-6 and the junction of C306 and C3ll.
3. Corresponding changes to the wiring diagrams affected by the revisions in paragraphs 1 and 2, will be made in Figure $7-37$ (page 7-65, 7-66) and 7-45 (page 7-81, 7-82), to come later.

RADIO CORPORATION OF AMERICA - RCA VICTOR DIVISION
Camden, New Jersey, U.S.A.
Contract: NObsr-39421
T-4 page 1
IB-38482- .
(of 2 pages)

## RESTRICTED

4. Make following changes to Section 8:

Page No.
8-33 For R-304: Change description to that used for R-615 on page 8-36; add function, "divereity control dropping" and make all other column entries same as that for $R-615$, except that spare parts totals should be " $6,21,21$ " and involved symbol desig. Ehould read, "R-304, R-615, R-621, R-6e2, R-624, R-625, R-912, R-917, R-918, R-937"。

8-36 For R-615: Change description to "Same as R-304"; delete all column entries excepting the function column.

8-37 For R-621, R-622, R-624, R-625: Change description to "Same as R-304".

8-42 For R-912, R-917, R-918: Change description to "Seme as R-304"。

8-44 For R-937: Change description to "Same as R-304". For R-940: Change function to "V-906 and V-907 Plate Dropping".

8-61 For N16-R-50632-431: Change key symbol from "R-615" to "R-304".

14 December 1950
Temporary Correction T-3
to Instruction Book for
Frequency Shift ConverterComperator Groups AN/URA-6, AN/URA-7 and Frequency Shift Converter CV-57/URR
NAVSHIPS 91355

Pages 1-8 and 1-9:
In Table I-I, after the words "Receiver Coupling Kit" add "Standard Navy Stock No. F16-C-91911-1005 ${ }^{\circ}$

Page 3-5:
In sub-paragraph $3 \underline{h}(1)$ change "plate pin 8 " to read "grid pin 4"
Page 3-6:
In Figure 3-5, on socket X303 chenge PIN 8 to read PIN 4
Page 3-17:
At beginning of paragraph 7 add the following NOTE:
NOTE: Certain adjustments may require the chassis to be withdrawn or removed from the case. This is done as follows:
a. TO SLTDE THE CHASSIS OUT OF THE CASE:
(1) Grasp the handles, push the button near the top of each handle with the thumb, turn the left-hand hande clockwise and the right-hand handle counterclockwise as far as they will go.
(2) Pull the chassis out of the case as far as it will go and return the handles to their original positions.
b. TO SLIDE CHASSIS INTO CASE:
(1) Grasp the handes, push the button near the top of each handle, turn the left-hand handle clockwise and the right-hand handle counterclockwise as far as they will go.
(2) Slide the chassis into the case as far as it will go.
(3) When completely in case, return handles to normal position to lock chassis in place.

> Radio Corporation of America
> RCA Victor Division
> Camden, New Jersey, U.SoA.

Page 3-17 (continued):
C. TO CHANGE CHASSIS POSITION AFTER VITBDRAWING CHASSIS FROM CASF:
(1) Grasp the handles, push the bell-shaped buttons near the inside bottom of the handies, and raise or lower the chassis aproximately to one of the locking positions.
(2) Release the buttons and move the chassis until the locking mechenism snaps into position.
a. TO RRMOVE CHASEIS FROM RATIS:
(I) Slide chassis out of case end set to vertical position.
(2) Slide retainers (Just forward of chassis pivots) upward until top eyelet is free of slot.
(3) Let retainer drop. Press bell-shaped buttons and lift chassis forward from rails.
e. TO REFIACE CHASEIS ON RAIIS:
(1) Check that the retainers on each side are henging downward.
(2) Hang chascia on raile, by the pivots, puching it to the rear as far as it will go.
(3) Push vell-shaped buttons. Pull the retainers as high as they will go, press them egaingt mounting plate, and slide downard as far as they will go beine careiul to see that top rivet in retainer engeges slot in mounting plate.

WARNING
This equiment employs voltages which sre dangerous and may be fatal if contacted. Always observe all safety regulations and precautions. See Safety Notice and Highvoltage warning printed on pages viii and ix in the Front Matter of instruction book.

Pace 7-1:
At end of text in second colum, add "Refer to Section 3, paragraph 7, for instructions on removal of chassic from case"

Page 7-26:
For T202, $d-c$ resistance should reed 20 ohme for the primary and 20 ohms for the secondary.

Page 7-71, 7-72:
In upper left comer of Figure 7-40, change aestination of lead to read "RBB-RBC X303 ITN 4, RDN X6 ETH 8"

Page 7-73:
At bottom left corner of Figure 7-1, change destinction of lead to read "RBB-PBC X3O3 YTN 4, RDN X5 ITN 8"

NAVSHIPS 91355

SPECIAL NOTICE FOR NAVSHIPS 91355
REGARDING
PANORAMIC COUPLING KIT TYPE CRV－10563－B

This inetruction book for Frequency Shift Converter－Comparator Groups AN／URA－ 6 and AN／URA－7 and Frequency Shift Converter CV $-57 / \mathrm{TRR}$ ，NAVSHIPS 91355，is supplied in lieu of a separate book for Panoramic Coupling Kit，Type CRV－10563－B。

Information on Panoramic Coupling Kit，Type CRV－I0563－B is in－ cluded on pages $1-9,1-10,2-10,3-1$ ，and $7-11$ and illustrated on Figures $1-1 c, 3-1$ to $3-9$ inclusive， $7-40$ and $7-41$ ．

Methods for modifying RBB，RBC，and RDM equipments for use with Frequency Shift Converter CV $57 / \mathrm{URR}$ and Frequency Shift Converter－ Comparator Group AN／URA－6 are covered in this book．However the Panoramic Coupling Kit，Type CRV－10563－B may also be used for other applications．In each case refer to the instruction book for the particular equipment concerned．

## GUARANTEE

The equipment, including all parts and spare parts, except vacuum tubes, batteries, rubber and material normally consumed in operation, is guaranteed for a period of one year from the date of delivery of the equipment to and acceptance by the Government with the understanding that all such items found to be defective as to material, workmanship or manufacture will be repaired or replaced, f.o.b. any point within the continental limits of the United States designated by the Government, without delay and at no expense to the Government; provided that such guarantee will not obligate the Contractor to make repair or replacement of any such defective items unless the defect appears within the aforementioned period and the Contractor is notified thereof in writing within a reasonable time and the defect is not the result of normal expected shelf life deterioration.

To the extent the equipment, including all parts and spare parts, as defined above, is of the Contractor's design or is of a design selected by the Contractor, it is also guaranteed, subject to the foregoing conditions, against defects in design with the understanding that if ten percent ( $10 \%$ ) or more of any such said item, but not less than two of any such item, of the total quantity comprising such item furnished under the contract, are found to be defective as to design, such item will be conclusively presumed to be of defective design and subject to one hundred percent ( $100 \%$ ) correction or replacement by a suitably redesigned item.

All such defective items will be subject to ultimate return to the Contractor. In view of the fact that normal activities of the Naval Service may result in the use of equipment in such remote portions of the world or under such conditions as to preclude the return of the defective items for repair or replacement without jeopardizing the integrity of Navy communications, the exigencies of the Service, therefore, may necessitate expeditious repair of such items in order to prevent extended interruption of communications. In such cases the return of the defective items for examination by the Contractor prior to repair or replacement will not be mandatory. The report of a responsible authority including details of the conditions surrounding the failure, will be acceptable as a basis for affecting expeditious adjustment under the provisions of this contractural guarantee.

The above one year period will not include any portion of time the equipment fails to perform satisfactorily due to any defects, and any items repaired or replaced by the Contractor will be guaranteed anew under this provision.

## INSTALLATION RECORD

Contract Number NObsr-39421<br>Date of Contract, 30 June 1947<br>Serial Number of equipment<br>Date of acceptance by the Navy<br>Date of delivery to contract destination<br>Date of completion of installation<br>Date placed in service

Blank spaces on this page shall be filled in at time of installation. Operating personnel shall also mark the "date placed in service" on the date of acceptance plate located below the model nameplate on the equipment, using suitable methods and care to avoid damaging the equipment.

## REPORT OF FAILURE

Report of failure of any part of this equipment, during its entire service life, shall be made to the Bureau of Ships in accordance with current regulations using form NAVSHIPS NBS 383 (revised). The report shall cover all details of the failure and give the date of installation of the equipment. For procedure in reporting failures see Chapter 67 of the Bureau of Ships Manual or superseding instructions.

## ORDERING PARTS

All requests or requisitions for replacement material should include the following data:

1. Federal stock number or, when ordering from a Marine Corps or Signal Corps supply depot, the Signal Corps stock number.
2. Name and short description of part.

If the appropriate stock number is not available the following shall be specified:

1. Equipment model or type designation, circuit symbol, and item number.
2. Name of part and complete description.
3. Manufacturer's designation.
4. Contractor's drawing and part number.
5. JAN or Navy type number.

## DESTRUCTION OF ABANDONED MATERIAL IN THE COMBAT ZONE

In case it should become necessary to prevent the capture of this equipment, and when ordered to do so, DESTROY IT SO THAT NO PART OF IT CAN BE SALVAGED, RECOGNIZED, OR USED BY THE ENEMY. BURN ALL PAPERS AND BOOKS.

## Means:

1. Explosives, when provided.
2. Hammers, axes, sledges, machetes, or whatever heavy object is readily available.
3. Burning by means of incendiaries such as gasoline, oil, paper or wood.
4. Grenades and shots from available firearms.
5. Burying all debris, where possible and when time permits.
6. Throwing overboard or disposing of in streams or other bodies of water.

## Procedure:

1. Obliterate all identifying marks. Destroy nameplates and circuit labels.
2. Demolish all panels, castings, switch and instrument boards.
3. Destroy all controls, switches, relays, connections and meters.
4. Rip out all wiring and cut interconnections of electrical equipment. Smash gas, oil, and water cooling system, in gas engine generators, etc.
5. Smash every electrical or mechanical part, whether rotating, moving or fixed.
6. Break up all operating instruments such as keys, phones, microphones, etc.
7. Destroy all classes of carrying cases, straps, containers, etc.
8. Bury or scatter all debris.

## DESTROY EVERYTHING!

## SAFETY NOTICE

The attention of officers and operating personnel is directed to Chapter 67 of the Bureau of Ships Manual or superseding instructions on the subject of radio safety precautions to be observed.

This equipment employs voltages which are dangerous and may be fatal if contacted by operating personnel. Extreme caution should be exercised when working with the equipment.

While every practicable safety precaution has been incorporated in this equipment, the following rules must be strictly observed:

## KEEP AWAY FROM LIVE CIRCUITS:

Operating personnel must at all time observe all safety regulations. Do not change tubes or make adjustments inside equipment with high voltage supply on. Under certain conditions dangerous potentials may exist in circuits with power controls in the off position due to charges retained by capacitors. To avoid casualties always remove power and discharge and ground circuits prior to touching them.

DONT SERVICE OR ADJUST ALONE:
Under no circumstances should any person reach within or enter the enclosure for the purpose of servicing or adjusting the equipment without the immediate presence or assistance of another person capable of rendering aid.

## DON'T TAMPER WITH INTERLOCKS:

Do not depend upon door switches or interlocks for protection but always shut down motor generators or other power equipment. Under no circumstances should any access gate, door, or safety interlock switch be removed, short-circuited, or tampered with in any way, by other than authorized maintenance personnel, nor should reliance be placed upon the interlock switches for removing voltages from the equipment.

## RESUSCITATION

AN APPROVED POSTER ILLUSTRATING THE rules for resuscitation by the prone PRESSURE METHOD SHALL BE PROMINENTLY DISPLAYED IN EACH RADIO, RADAR, OR SONAR ENCLOSURE. POSTERS MAY BE OBTAINED UPON REQUEST TO THE BUREAU OF MEDICINE AND SURGERY.

## WARNING

Voltages over 300 volts shall be measured as follows:
(1) De-energize the equipment. Ground terminals to be measured to ground to discharge any capacitors connected to these terminals. (See Note F)
(2) Connect meter to terminals to be measured using a range higher than the expected voltage.
(3) WITHOUT TOUCHING METER OR TEST LEADS, energize the equipment and read the meter.
(4) De-energize the equipment. Ground the terminals connected to the meter to ground before disconnecting meter.

## NOTES:

(A) MAKE SURE you are NOT GROUNDED whenever you are adjusting equipment or using measuring equipment.
(B) In general, USE ONE HAND only when servicing live equipment.
(C) If test meter must be held or adjusted while voltage is applied GROUND the case of the meter before starting measurement and DO NOT touch the live equipment or personnel working on live equipment while you are holding the meter. Some moving vane type meters should not be grounded. These should not be held during measurements.
(D) DO NOT FORGET that high voltages MAY BE PRESENT across terminals that are nominally low voltage, due to equipment breakdown. Be careful even when measuring low voltages.
(E) DO NOT use test equipment known to be in poor condition.
(F) High voltage high capacity capacitors should be discharged with a grounding stick with approximately 10 ohms in series with the grounded line. Where neither terminal of a capacitor is grounded, short capacitor terminals to each other.

Figure 1-1 b. Frequency Shift Converter CV-57/URR

# SECTION 1 

## GENERAL DESCRIPTION

## 1. SCOPE OF THIS BOOK.

This book covers Frequency Shift Converter CV-57/URR, (395-470 kc type, single channel), and Frequency Shift Converter-Comparator Groups AN/URA-6 (395-470 kc type, dual channel) and AN/URA-7 ( $50-\mathrm{kc}$ type, dual channel). It includes description, theory, installation, operation, maintenance, and parts lists. Refer to Tables at the end of this section for a listing of items included in the above major equipments.

## 2. PURPOSE AND BASIC PRINCIPLES.

These equipments are designed to operate on frequency shift keyed radio telegraph signals, as derived from the intermediate-frequency circuits of communication receiving equipments, to provide keying facilities for the operation of teletype printers or other similar automatic recording devices.

To achieve the above purpose the signals are filtered to remove all frequencies except those necessary for a good signal, amplified to a level above the saturation point of a limiter, and passed through a discriminator to obtain positive and negative pulses. These pulses are filtered and used to trigger a double Eccles-Jordan flip-flop circuit to operate d-c keying tubes which key the teletypewriter loop. A d-c pulse, identical with the d-c pulses appearing in the teletypewriter loop, in addition keys an internal tone for transmission to a remote point.

In each of the AN/URA--6 and AN/URA-7 equipments two receiving channels are used in a diversity arrangement, and a Comparator (CM-14/URR) selects the stronger signal to control the teletypewriter loop and the keyed tone. Each channel can be used independently in separate circuits, no
diversity being then utilized. The CV-57/URR operates on one channel only.

## 3. DESCRIPTION OF UNITS.

a. FREQUENCY SHIFT CONVERTER CV-57/-URR.-See Figure 1-1b. Frequency Shift Converter CV-57/URR may be used either alone or as a component of the Frequency Shift Converter-Comparator Group AN/URA-6. It is housed in a case 5-1/8 inches high, 17-5/16 inches wide, and 11-13/16 inches deep. The unit is finished in smooth grey enamel. Removable brackets with shock mounts are supplied for table mounting; when so mounted the overall height is $7-1 / 8$ inches. Brackets are supplied for standard relay rack installation without the shock mounting feature (See Figure 1-2). The chassis slides completely out of the cabinet, on rails, and can be placed in one of several positions to facilitate servicing (see Figure 7-1). The front panel controls

Figure I-I c. Receiver Coupling Kit Type 10563

Figure 1-2. Gussef, Rack Mounts for frequency Shift Converter CV-57/URR
which do not normally need frequent attention are located behind a cover (containing an air filter) in the center of the panel. Screwdriver-operated controls are mounted behind oilcup-type hole covers. Jacks are provided, under a spring cover, on the lower left corner for checking the tone and teletypewriter outputs (See Figure 4-1). Power-line fuses are located on the filter unit attached to the rear of the cabinet and are accessible only from within the cabinet (see Figure 5-1).

Frequency Shift Converter CV-57/URR includes the following units, which are described below (see Figure 1-4). Mention is also made of Frequency Shift Converter CV-71/URR which differs from the CV-57/URR in that it operates at $50-\mathrm{kc}$ input frequency and is supplied only as a part of Frequency Shift Converter-Comparator Group AN/URA-7.

| UNIT NAME | SYMBOL SERIES |
| :--- | ---: |
| Converter Chassis | 1400 |
| Cable Filter Unit | 1100 |
| Input Unit (for CV-57/URR) | 100 |
| Input Unit (for CV-71/URR) | 200 |
| I-F Unit | 300 |
| Keyer Unit | 600 |
| Tuning Monitor Unit | 700 |
| Power Supply Unit | 800 |
| Jumper Cable | W1402 |

(1) CONVERTER CHASSIS (see Figure 1-4). -The Converter Chassis supports all the Frequency Shift Converter units except the Cable Filter Unit which is mounted on the back of the case. The units are interconnected by plugs and jacks when inserted
in place. A plug, P1401, on the rear of the Converter chassis connects this chassis to jack J1101 on the Cable Filter Unit when in operating position. For servicing, the chassis can be slid out of the cabinet and locked in any one of four positions while still supported by cabinet rails. A jumper cable is provided for connecting the chassis (see Figure 3-15) with the Cable Filter Unit when the chassis is withdrawn from the cabinet. An air filter, in the center of the panel, covers the controls requiring only occasional adjustment, but makes them readily accessible by a half-turn screw holding the cover against the panel. Two jacks, TTYP and PHONES, are located on the bottom left of the panel, protected by a cover. To the right of these jacks is the neon lamp $\mathrm{B}+$ indicator. The POWER OFF-ON switch is located to the right center of the air filter.
(2) CABLE FILTER UNIT (for CV-57/URR). -See Figure 7-2. All external connections to the equipment are made through the Cable Filter Unit. Filtering is provided for the power lines, teletypewriter output circuit, tone output circuits, and cathode-ray tube remote vertical circuit. The Cable Filter Unit and Converter Chassis are interconnected automatically when the Converter Chassis is pushed in place. The entire filter assembly is fastened to the rear of the cabinet by eight screws accessible from the inside of the cabinet (see Figure 5-1).

Looking in the front of the cabinet, the items of the Cable Filter Unit are arranged from left to right as follows: fuses, Allen wrenches, fan, and spare fuses. Below the spare fuses is a jack, J1101, through which all connections between the Converter Chassis and the Cable Filter Unit are made. The fuses can only be replaced after sliding the Converter Chassis out of the case.

The housing is in the shape of a triangle with the apex toward the rear. On the lower side of the triangle are mounted all jacks for external connections. A removable cover, held in place by five halfturn screws, forms the top of the assembly, making all internal connections and parts available for repair or replacement (see Figure 3-10).
(3) INPUT UNIT FOR CV-57/URR.-The Input Unit for the CV-57/URR Converter converts the receiver intermediate frequency of $395-470$ kilocycles to a frequency of 40 kilocycles for the I-F Unit. Three tubes are used, an oscillator, an automatic frequency control tube, and a converter. The unit is located on the left front of the Converter Chassis and is tunable over the range of 395 to 470 kilocycles to match the receiver with which it operates.

The unit (see Figures 7-11, 7-12) is supported in the Converter Chassis by its front and rear flanges and held in place by captive screws, two on the back flange and one on the front flange. The front and rear brackets extend upward to protect the unit and serve as handles for lifting the unit into and out of the Converter Chassis. The single tuning control and a fixed capacitor (C108) are located on the front bracket. The tuning capacitor couples to the panel knob shaft by a mechanical coupler when the unit is mounted in place.

The location of the various parts on the bottom is as follows, looking at the unit with the bottom turned upward. At the front, extending crosswise is the connecting plug P101. On the left side, from front to rear, are tube socket X103, capacitors C118 and C115 (C118 is on the left), transformers T103 and T102. On the right side are a feed-through terminal E102, tube socket X101, capacitor C102, transformer T101, tube socket X 102 , and capacitors C110 and C101. Capacitor C110 is on the right. Extending along the center from P101 to the rear of the chassis is terminal board E101. Capacitor C120 is near the rear of the terminal board.
(4) INPUT UNIT FOR CV-71/URR.-This Input Unit is a part of Frequency Shift Converter CV-71/URR which is supplied as a component of the Frequency Shift Converter-Comparator Group AN/-

URA-7. It converts the intermediate frequency of the associated receiver from 47.5-52.5 kilocycles to a 40-kilocycle frequency for the I-F Amplifier Unit.

The unit (see Figures 7-11, 7-12) is essentially similar in construction to the Input Unit described above. Its components are designated by symbols in the 200-series.
(5) I-F UNIT.-The I-F Unit has one stage of intermediate-frequency amplification, a limiter stage, and a discriminator stage. One signal input is required and four signal outputs are provided, a diversity control signal, an automatic frequency control signal (AFC), the Tuning Monitor and remote tuning monitor signal, and the output signal to the keyer. Three switches and one potentiometer make up the controls, which are all adjustable from the front panel.

The I-F Unit (see Figures 7-13, 7-14) is mounted on the Converter Chassis, between the Keyer Unit and Input Unit, by its front and rear flanges. It is secured in place by one captive screw through the front flange and two captive screws through the rear flange. The front and rear brackets extend upward to form handles for lifting the unit into and out of the main chassis. All controls are mounted on the front bracket and couple to the knob shafts when the unit is mounted in place, provided the driving pins are properly aligned. Facing the rear of the

Figure 1-3. Cables for AN/URA-6, AN/URA-7, and CV-57/URR Equipments

AN/URA-6, AN/URA-7<br>CV-57/URR<br>GENERAL DESCRIPTION

front bracket the TUNE-OPERATE switch, S302, is at the top right, with the AFC ON-OFF switch, S303, located below. At the top left is the THRESHOLD control R318. Below the THRESHOLD control is the NARROW-WIDE switch S301.

On the bottom front center of the chassis is located the connecting plug P301. On the left side, from front to rear, are tube socket X303, transformer T304, tube socket X302, and transformer T303. On the right side, from front to rear, are transformer T301, capacitor C318, transformer T302, and tube socket X301. Two terminal boards, mounted back to back, extend from the center of plug (P301) to the rear of the chassis. Terminal board E302 is to the left and terminal board E301 is to the right. Switch 5301 extends above the chassis in line with the two terminal boards. Various mica capacitors are supported by clips underneath the chassis.
(6) KEYER UNIT.-The Keyer Unit is suppied with d-c signal pulses from the I-F Unit. These pulses serve to control the electronic keying tubes to key the external teletypewriter loop. The unit also supplies an on-off tone signal of adjustable level and frequency for remote teletypewriter operation and monitoring purposes.

One Keyer Unit (see Figures 7-9 and 7-10) is mounted at the front center of the Converter Chassis and a similar unit is mounted on the Comparator Chassis; each Keyer Unit is held in place by three captive screws, two at the rear and one at the front. Brackets at the front and rear serve as handles for lifting the unit into and out of the chassis. The front bracket is also the mounting for all the controls of the unit. On the bottom front center is located the connecting plug P601. On the right-hand side of the plug is terminal board E602 and on the left-hand side is terminal board E601. To the rear of the plug is a row of capacitors, $\mathrm{C} 603, \mathrm{C} 616, \mathrm{C} 615$, and C 601 from left to right, and four tube sockets, X601, $\mathrm{X} 606, \mathrm{X} 602$, and X 603 , to the rear of the capacitors. In back of the tube sockets are terminal boards E 605 and E604, mounted over the terminals of Z601 and L601. Transformer T601 is to the right. To the rear of the items just mentioned are four tube sockets, X607, X608, X604, and X605, and four capacitors, C617, C618, C606, and C602. Terminal board E603 is fastened to the rear bracket. The rear bracket also mounts a toggle switch, S604.

Mounted on the front bracket are the following controls: S601, S602, S603, R613, R629, and R633. Looking at the top right of the rear of the front

Figure 1-4. Frequency Shift Converfer CV-57/URR or CV-71/URR, Top View
ports a capacitor, C701, and a tube socket, X701, with its shield. On the bottom of the chassis are the connecting plug, P701, a terminal board, E701, for resistors and small capacitors, and a bracket mounting controls VERT GAIN, R701, INTENSITY, R713, and CAL IN switch, S701.

The control shafts of $R 701$ and $S 701$ connect or disconnect with the panel knob shafts by means of mechanical couplings on removal or replacement of the unit. Controls R702, R713, and R715 are screw-driver-adjusted and are accessible through spring covers on the top of the front panel. Access to R705 can only be had by withdrawing the chassis from the case.
(8) POWER SUPPLY UNIT (for CV-57/URR or CV-71/URR).-See Figures 7-3 and 7-4. The Power Supply Unit supplies power to all the units assembled on the Converter Chassis. This Unit has no controls and is readily changed by unscrewing four captive screws and lifting from position. All connections are made by a single plug, P801.

The chassis is formed from aluminum; flanges at both ends support it on the Converter Chassis (looking from the front of the converter Chassis with the Power Supply Unit in its operating position). The right-hand flange has one captive screw and the lefthand flange has two captive screws. A fourth captive screw is located beside socket X801. These screws hold the unit in place on the Converter Chassis. The power transformer, T801, is mounted

Figure 1-5. Comparator CM-14/URR, Chassis Top View
on the left side of the chassis and the remaining components are grouped on the right side. Capacitor C802A,B is mounted by an octal socket, X804, with a screw-adjusted clamp to hold it in place.

Filter Choke L801 and capacitor C801A,B,C are on the top of the chassis with their terminals passing through the chassis for wiring convenience. A bracket, on the right-hand side of the chassis, and the power transformer provide means of lifting the unit into and out of the Converter Chassis. Four tube sockets are mounted in the chassis, X801 through X804, three for the tubes and one for the filter capacitor C802A, B. Under the chassis is a terminal board, E801, and the connecting plug P801.
b. FREQUENCY SHIFT CONVERTER-COMPARATOR GROUPS AN/URA-6 AND AN/URA-7.-The Frequency Shift Converter-Comparator Groups AN/URA-6 and AN/URA-7 differ only in the Converters supplied. The AN/URA-6 Group is supplied with two CV-57/URR Converters while the AN/URA-7 Group is supplied with two CV71 URR Converters. The Converters, in turn, differ only in their Input Units: The CV-57/URR Converter operates on a 395- to 470-kc input signal and its Input Unit is identified by component symbols in the 100 series; the CV-71/URR Converter operates on a 47.5- to $52.5-\mathrm{kc}$ input signal and its Input Unit is identified by component symbols in the 200 series.

Each Frequency Shift Converter-Comparator Group consists of two Frequency Shift Converter CV-57/URR or CV-71/URR and one Comparator CM-14/URR, all secured in a table-mounting frame (see Figure 1-1a). The units may be removed from this frame and mounted in a standard relay rack. The Converters are connected to separate receivers. The Comparator selects the stronger of the two signals from the Converters to key the teletypewriter loop and the tone signal.

The Comparator differs in appearance from the Frequency Shift Converters in that it has a meter in place of the cathode-ray tube of the Converter units.

The Frequency Shift Converters are described in the preceding paragraph. The Comparator CM-14/URR will now be described. It is made up of the following units.

| UNIT NAME | SYMBOL GROUP |
| :--- | ---: |
| Comparator Chassis | 1600 |
| Cable Filter Unit | 1300 |
| Diversity Selector Unit | 900 |
| Keyer Unit | 600 |
| Power Supply Unit | 1000 |
| Jumper Cable | W1602 |

These units are described below, except the Keyer Unit which is identical to the Keyer Unit used in the

Converters and was described previously in paragraph $3 a(6)$.
(1) COMPARATOR CHASSIS. - See Figure 1-5. The Comparator Chassis supports all the Comparator units except the Cable Filter Unit which is mounted on the back of the case. The units are interconnected by plugs and jacks when inserted in place. A plug, J1601, on the rear of the Comparator Chassis connects the chassis to J 1301 on the Cable Filter Unit when in operating position. For servicing, the chassis can be slid out of the cabinet and locked in any one of four positions while still supported by cabinet rails. A jumper cable is provided for connecting the chassis (similar to that shown in Figure 3-15) with the Cable Filter when the chassis is withdrawn from the cabinct. An air filter and cover, in the center of the panel, cover the controls requiring only occasional adjustment, but make them readily accessible by a half-turn screw holding the cover against the panel.

Two jacks, T'TYP and PHONES, are located on the bottom left of the panel protected by a cover. To the right of the jacks is the neon lamp $\mathbf{B +}$ indicator. The POWER OFF-ON switch is located to the right center of the air filter.
(2) CABLE FILTER UNIT (for CM-14/URR). -See Figure 7-2. Converter and external connections to the Comparator are made through the Cable Filter Unit. Filtering of the power lines and tone output circuits is provided. Connections between the Cable Filter Unit and Comparator Chassis are made automatically when the Comparator Chassis is pushed in place. The entire filter assembly is fastened to the rear of the cabinet by eight screws accessible from the inside of the cabinet (see Figure 5-2).

The housing is in the shape of a triangle with the apex toward the rear. On the lower side of the triangle are mounted all jacks for external connections. A removable cover, held in place by five halfturn screws, forms the top of the assembly and makes all internal connections and parts available for repair or replacement (see Figure 7-2).

Looking at the front of the cabinet, the items of the Cable Filter Unit are arranged from left to right as follows: fuses, Allen wrenches, fan, and spare fuses. Located below the spare fuses is a jack, J1301, through which all connections between the Comparator Chassis and the Cable Filter Unit are made. The fuses can only be replaced after sliding the chassis out of the case.
(3) DIVERSITY SELECTOR UNIT.-See Figures 7-17 and 7-18. The Diversity Selector Unit
receives the incoming signal being fed into each of the two Converter channels and selects the stronger of the signals to operate a gating circuit. The d-c pulses from the two Converter discriminators are fed into the gating circuit. The discriminator output from the Converter receiving the stronger signal is selected to operate the Comparator Keyer Unit.

The Diversity Selector Unit is supported, by its front and rear flanges, on the left front of the Comparator Chassis. Two captive screws through the rear flange and one captive screw through the front flange hold the unit in place. The front and rear brackets extend upward to make handles for inserting and removing the unit from the Comparator Chassis. The three controls, S901, R905, and R923, are mounted on the front bracket.

Underneath the chassis at the front center is a plug, P901, through which all connections are made. To the left is terminal board E904 and on the right is terminal board E905. To the rear of the plug are four tube sockets, X907, X906, X902, and X901 from left to right. In the center, arranged from left to right, are capacitors C919, C920, C914, C913, and C912. Mounted above the capacitors are terminal boards E902 and E903. Terminal board E906 is mounted on the right-hand side of E902. To the rear of the terminal boards is a row of tube sockets, X905, X904, X903, X909, and X908 from left to right. Mounted on the rear bracket is terminal board E901.

Looking at the right rear of the bracket is the CHANNEL A-COMBINED-CHANNEL B switch, S901. To the top left is the GATE BAL control, R923, with the CONT BAL control, R905, below. The CHANNEL A-COMBINED-CHANNEL B switch couples to the panel knob by means of a mechanical coupler. The GATE BAL and CONT BAL controls are screwdriver adjusted through the front panel.
(4) POWER SUPPLY UNIT (for CM-14/URR). -See Figures 7-5 and 7-6. The Power Supply Unit supplies power to all the units assembled on the Comparator Chassis. This unit has no controls and is readily changed by unscrewing four captive screws and lifting from position. All connections are made by a single plug, P1001.

The chassis is formed from aluminum with flanges at both ends for support on the Comparator Chassis (looking from the front of the chassis with the Power Supply Unit in its operating position). The right- and left-hand flanges have, respectively, one and two captive screws. A fourth captive screw is located beside the socket $\mathbf{X 1 0 0 1}$. These screws hold the unit in place on the Comparator Chassis. The
power transformer, T1001, is mounted on the left side of the chassis and the remaining parts are grouped on the right side. Capacitor $\mathrm{C} 1002 \mathrm{~A}, \mathrm{~B}$ is mounted by an octal socket, X1004, with a screwadjusted clamp to hold it in place.

Filter choke L1001 and capacitor C1001A,B,C are mounted on the top of the chassis with their terminals passing through the chassis for wiring convenience. A bracket, fastened to the right side of the chassis, together with the power transformer provide means of lifting the unit into or out of the Comparator Chassis. Four sockets, X1001 through X1004, are mounted in the chassis, three for the tubes and one for the filter capacitor C1002A,B. Under the chassis is located a terminal board, E1001, and the connecting plug P1001.
c. RECEIVER COUPLING KIT, TYPE 10563.The Receiver Coupling Kit is to be installed in an associated radio receiver (such as Navy Model RBB, RBC, or RDM) to provide for a low-impedance line from the receiver third i-f amplifier plate circuit to the input circuit of the Converter unit. The kit contains two major sub-assemblies, a Cathode-Follower Assembly and a Low-Pass Filter Unit. Figures 7-15 and 7-16 show the physical arrangement of the parts. The circuits are described in Section 2 while installation instructions are given in Section 3. This kit is for use only with Frequency Shift Converter CV--57/URR and Frequency Shift Converter-Comparator Group AN/URA-6, which operate on an input frequency of 395 to 470 kc . It is neither supplied nor intended for use with Frequency Shift Converter-Comparator Group AN/URA-7, which operates on an input frequency of 47.5 to 52.5 kc .

## 1. INTRODUCTION.

This section covers the theory of operation of the single-channel Frequency Shift Converter CV-57/URR, the dual-channel diversity Frequency Shift Converter-Comparator Groups AN/URA-6, AN/-URA-7, and the Receiver Coupling Kit 10563. (Frequency Shift Converter CV-71/URR is discussed in paragraph 17 of this section, as a part of Frequency Shift Converter-Comparator Group AN/URA-7.) An antenna, radio receiver, and teletypewriter with battery or power supply are required for the singlechannel equipment. Dual-channel diversity equipment requires two antennas, two receivers, and a teletypewriter with battery or power supply.

The Converter changes a frequency shift signal into d-c pulses sufficient to operate a teletypewriter or other automatic recording devices. A frequency shift signal is one whose normal frequency is shifted to another frequency for a period of time corresponding to the coding of the information being transmitted. The subject equipment is designed to handle shifts of from 10 to 1000 cycles.

## 2. SINGLE-CHANNEL FREQUENCY SHIFT CONVERTER CV-57/URR.

In the CV-57/URR unit (see Figure 2-1, SingleChannel Equipment CV-57/URR Block Diagram) the signal is filtered, converted to a $40-\mathrm{kc}$ frequency, amplified, clipped (by the limiter) and fed through the discriminator. The discriminator output is amplified, filtered, amplified again, and triggers two Eccles-Jordan flip-flop stages in cascade to key the tone oscillator and teletypewriter-loop keyer tubes.

Frequency Shift Converter CV-57/URR includes the following operating sub-assemblies shown interconnected on the System Schematic, Figure 7-19.

| FIGURE |  |

## 3. CONVERTER CHASSIS ASSEMBLY (for CV-57/URR).

Refer to the System Schematic Figure 7-19. All connections to the Cable Filter and to the units on the Converter Chassis are made by plugs and jacks. Plug P1401, mounted on the rear of the Converter Chassis, engages with jack J1101 on the Cable Filter Unit when the Converter Chassis is properly seated in the case. This permits external cable connections, which are made to the Cable Filter Unit, to be carried into the chassis assembly cable and distributed to jacks J1403 to J1407 inclusive. These jacks, in turn, engage the proper sub-assembly plugs when these units are assembled in the Converter Chassis. Other electrical items of the chassis are the B+ "on" indicator and socket I/X1401, the POWER OFF-ON switch S1401, the T'TYP and PHONES jacks J1401 and J402, and the B + dropping resistor R1402.

The B+ "on" indicator is a neon lamp connected between ground and the 200 -volt supply in series with a limiting resistor R807 located in the power supply. The neon lamp glows to indicate that a voltage of 200 volts is present in the power supply.

The POWER OFF-ON switch makes or breaks both legs of the a-c line into the power transformer primary. The TTYP jack, J1401, is connected in series with the external teletypewriter loop circuit and is used to meter the teletypewriter loop current and otherwise monitor the loop circuit. The PHONES jack, J 1402 , is supplied with keyed tone output signals through the Tone Output Filter, Z1101, for monitoring purposes.

## 4. CABLE FILTER UNIT (for CV-57/URR).

Refer to Schematic Diagram, Figure 7-24. All external cable connections are made by jacks mounted on the rear of the Cable Filter Unit. These jacks and their functions are listed below together with the names with which they are designated on the equipment.

| SYMBOL | No. NAME | FUNCTION |
| :---: | :---: | :---: |
| J1102 | VERT. CRTREMOTE | Remote vertical cathode-ray tube signal |
| $J 1104$ | EXT. TONE IN | External tone signal input |
| J1105 | TONE OUTPUT | Tone output |
| J1106 | TTYP OUTPUT | Teletypewriter signal (output) |
| J1107 |  | A-C power outlet |
| J1108 | PWR INPUT | A-C power input |
| J1109 | DIV. CONT | Diversity control voltage |
| J1110 | DIV. SIG | Diversity output signal |
| 11111 | I-F INPUT | I-F Input |

Electrical connections from these jacks to the various sub-assembly units on the Converter Chassis are made through jack J1101. This is mounted on the lower right-hand of the inside panel and engages plug P1401 mounted on the Converter Chassis.

The equipment is protected from overload by two three-ampere fuses, F1101 and F1102, each in series with one leg of the line. The fuses do not protect circuits which may be connected to a-c power outlet jack J1107.

A power line filter, Z1102, is inserted in the power line in series with the power transformer primary. This filter has an attenuation of at least 65 db from 14 kc to 10 mc and of at least 50 db from 10 mc to 30 mc when fully loaded. It prevents any signal generated in the equipment from entering the power line and also prevents external signals from entering the equipment.

A tone output filter, Z1101, is inserted in series with the tone output from the Keyer Unit. It has the same attenuation and purpose as the power line filter just described. The output connections of the tone filter are taken to the PHONES jack J1402 for monitoring purposes.

The tone output impedance is 600 ohms nominal from 595 to 1785 cycles with a maximum power output of at least 12 milliwatts across a 600 -ohm non-inductive load. The output circuit has its center tap brought out to terminal $B$ of the Tone Output jack J1105 and may be grounded if required by external conditions.

Other filtering circuits include resistor R1101, choke L1101, and capacitor C1103 to filter the cathode-ray tube remote signal; and choke L1102 and capacitor C 1102 to filter the teletypewriter output.

A fan, B1101, operates from the 115 -volt power line. Capacitor C1101 provides the necessary phase shift to operate the fan motor. The fan maintains an even temperature distribution when the equipment is in use.

## 5. INPUT UNIT (for CV-57/URR).

See Schematic Diagram, Figure 7-38. The Input Unit receives the intermediate-frequency (395 to 470 kc ) signal from the associated receiver. It converts it into a $40-\mathrm{kc}$ signal which it then feeds into the I-F Unit (discussed in paragraph 6). AFC is provided across the oscillator to correct for receiver drift. The following tubes are used in the Input Unit of the CV-57/URR Converter.

| SCHEMATIC SYMBOL | TUBE TYPE | function |
| :---: | :---: | :---: |
| V101 | JAN-6C4 | Oscillator |
| V102 | JAN-6AU6 | Automatic frequency control (AFC) |
| V103 | JAN-6BE6 | Converter |

The signal is fed from the receiver to the Converter through the Receiver Coupling Kit, which is mounted in the receiver: The output of this Coupling unit is fed through the Cable Filter Unit and plug P101 to the junction of capacitors C111, C112 of the Input Unit. These capacitors tune the primary of transformer T102 and provide proper impedance match. Additional selectivity is provided by transformers T102, T103 and associated tuning capacitors.

A characteristic is thereby obtained, such that the circuit bandwidth at 400 kc center frequency is not more than 7.6 kc at 6 db down; and not more than 56 kc at 60 db down.

The equipment is adjusted between 395 and 470 lac by adjusting the powdered-iron cores of the transformer windings.

The converted signal appears at the plate of tube V103 and is fed to the input of the I-F Unit through plug P101.

The oscillator tuned circuit, T101, is bridged by
two fixed capacitors, C104 and C119, and is adjusted to a frequency of 430 to 510 kc by a powdered-iron core. External tuning of the circuit over a narrow range is accomplished by C105, a variable air capacitor acting as a vernier.

The plate circuit of the automatic frequency control tube, V102, acts as a variable reactance across the oscillator tank circuit to tune the oscillator over a small range. The reactance presented by the tube depends on the transconductance, which is controlled by the AFC bias from the discriminator. This bias is obtained from the I-F Unit through pin 11 of P101 and filtered by resistors R103, R104, R105, and capacitor C108.

## 6. I-F UNIT.

See Schematic Diagram, Figure 7-36. The I-F Unit receives a $40-\mathrm{kc}$ signal from the Input Unit, which is amplified through highly selective transformers and fed to a discriminator whose output is applied to the Keyer Unit. The following tubes are used in the I-F Unit:

| CIRCUIT <br> SYMBOL | TUBE TYPE | fUNCTION |
| :---: | :---: | :--- |
| V301 | JAN-6AU6 | 1st I-F Amplifier |
| V302 | JAN-6AU6 | Limiter |
| V303 | JAN-6AL5 | Discriminator |

The signal from the Input Unit is fed to the primary of transformer T301 through pin 10 of plug P301. It is then applied, through transformer T302, to the grid of amplifier tube V301. Further selectivity is obtained through transformer T303 which applies the signal to the grid of limiter tube V302. Each i-f transformer has two coupling coils, one for narrow-band reception and one for wideband reception. A switch, S301, selects the coupling coil desired by means of the NARROW-WIDE knob on the front panel. Capacitors C302, C303, C305, C306, C307, C311, C313 tune the associated circuits.

The selectivity of these circuits is such that the bandwidth, at 6 db down, is between 0.8 and 1 kc in the NARROW position and between 1.6 and 2 kc in the WIDE position of the switch. The shape factor (bandwidth $60 \mathrm{db} /$ bandwidth 6 db ) does not exceed 3.75 and 3.5 in the NARROW and WIDE positions, respectively.

The signal appearing at the plate of tube V301 has an amplitude which is proportional to the receiver output; a portion of this signal is fed to pin 6 of plug P301 for diversity control in Comparator CM-14/URR.

Tube V302 operates as a limiter, using a grid leak, R309, to supply a bias voltage which increases as the
amplitude of the incoming signal increases. A bleeder, consisting of resistors R310 and R311, fixes the screen voltage to assist in the limiting action.

In the plate circuit of V 302 is the discriminator transformer, T304, with associated capacitors C314, C316, C317 which provide proper tuning. The transformer is also switched in the NARROW or WIDE position by the NARROW-WIDE control knob on the front panel (switch S301).

The discriminator diode, V303, supplies three output signals, as follows:
(a) A Monitoring signal, which is fed to the Tuning Monitor Unit and a remote cathode-ray tube monitor through pin 3 of P301.
(b) an AFC signal, which is fed to the converter oscillator of the Input Unit through pin 8 of P301,
(c) an output signal, which is fed to the Keyer Unit through the THRESHOLD control, R318, and pin 4 of P301.

The discriminator characteristic, when tube V302 is limiting, gives a $1.8-\mathrm{kc}$ spread between peaks on the WIDE position and a $1.35-\mathrm{kc}$ spread between peaks on the NARROW position. The slope sensitivity is about 0.04 volt per cycle on either position.

The AFC OFF-ON switch, S303, grounds the AFC voltage when in the OFF position. The TUNE OPERATE switch, S302, opens the output signal circuit and grounds the AFC voltage for tuning purposes.

## 7. KEYER UNIT.

See Schematic Diagram, Figure 7-42. The Keyer Unit receives the d-c pulses from the discriminator, amplifies and filters them to energize the EcclesJordan flip-flop circuit which, in turn, keys a power output stage to key the teletypewriter loop circuit. The output of the flip-flop circuit also keys on and off a tone oscillator for monitoring and transmission over telephone lines and radio links. The tubes used in the Keyer Unit are as follows:
schematic

| SYMBOL | TUBE TYPE | CIRCUIT FUNCTION |
| :--- | :--- | :--- |
| V601A | JAN-12AU7 | A-F Amplifier I |
| V601B |  | A-F Amplifier II |
| V602A | JAN-12AU7 | Balance Modulator |
| V602B |  | Trigger Driver |
| V603A,B | JAN-12AU7 | Trigger I |
| V604A,B | JAN-12AU7 | Trigger II |
| V605A | JAN-12AU7 | Tone Modulator |
| V605B |  | Tone Oscillator |
| V606 | JAN-6AL5 | D-C Restorer |
| V607 | JAN-6AQ5 | Teletypewriter Loop Keyer |
| V608 | JAN-6AQ5 | Teletypewriter Loop Keyer |

The audio signal from pin 14 of P 601 is amplified by a-f amplifier I tube, V601A. The output of this stage is fed through the LOW-HI-ADJ switch, S601,

# AN/URA-6, AN/URA-7 <br> CV-57/URR <br> THEORY OF OPERATION 

which is connected between the plate circuit of V601A and the input circuit of V601B. The LOW-HI-ADJ switch, S601, inserts a low-pass filter, Z601, for either low- or high-speed teletype signals or a calibration signal in the ADJ position.

Filter Z601 cuts off frequencies above those necessary for teletype operation. In the LOW position the filter response is flat within 6 db from 80 to 140 cycles and is down not less than 40 db from 240 cycles and above. However, capacitors C617, C618 cause the overall circuit response to be flat within 6 db from 80 to 125 cycles and down not less than 40 db from 200 cycles and above (these are approximate values only). In the HI position the filter response is flat within 6 db from 80 to 300 cycles and is down not less than 40 db from 500 cycles and above. However, capacitor C618 causes the overall circuit response to be flat within 6 db from 80 to 240 cycles and down not less than 40 db from 415 cycles and above (these are approximate values only).

The output voltage of a-f amplifier II tube, V 601 B , is applied to grid pin 2 of the trigger driver tube, V602B, through capacitor C616 and resistor R605. This same signal is fed to the Tuning Monitor through pin 5 of P601 to indicate proper setting of the THRESHOLD control on the I-F Unit. When the THRESHOLD control is properly adjusted this voltage should be approximately 17 volts peak to peak; the traces on the cathode-ray tube screen will then coincide with the top and bottom engraved lines on the Tuning Monitor window when the CAL IN switch, S701, is depressed. Accuracy of the trace indication can be checked by setting the LOW-HIADJ switch, S601, to the ADJ position and observing the traces to coincide with the top and bottom lines on the window when the CAL IN button is depressed. See Section 3, paragraph 7a(14).

Connected between the grid of the trigger driver tube, V602B, and ground is a d-c restorer tube, V606, and its associated circuits. This circuit selects a portion from the output of V601B near the zerovoltage axis, eliminating the superimposed noise and telegraph distortion. This is accomplished by two diodes, one which (pins 1 and 7) clips the negative portion and the other (pins 2 and 5), positively biased, clips the signal level above plug four volts. Therefore, appearing on the grid, pin 2, of the trigger driver, $V 602 \mathrm{~B}$, is a four-volt peak to peak square wave of plus two volts average. This square wave is identical to the discriminator square-wave output, except that the amplitude-modulated noise has been reduced and the $d-c$ component has been removed by capacitive coupling.

In normal frequency shift teletypewriter operation the teletypewriter loop circuit is closed during the standby, or mark signal. This keeps the teletypewriter in condition to receive the coding pulses which key the teletypewriter loop circuit through the keyer tubes, V607 and V608. The d-c component, from the discriminator, could be used to return the output tubes to conduction after each coding pulse has been received; however, since this component has been removed, a mark-return circuit is provided at the grid of the trigger driver, V602B, to accomplish this result.

The mark-return circuit has a normal and a reverse position and consists of resistor R 610 and switch S603B. This switch is used in the NORM position when the detected audio output from the receiver returns to a higher frequency in the mark or standby position. This permits the grid of V602B to return to plus four volts through resistor R610 and causes the output tubes, V607 and V608, to conduct. The REV position of switch S603B is used when the receiver output returns to a lower frequency and permits the grid of V602B to return to zero voltage.

The output signal of V602B is direct-coupled to an Eccles-Jordan flip-flop stage, V603 A,B, which in turn is capacitively coupled to another Eccles-Jordan flipflop stage, V604A,B; having two stable positions. The output, taken from the grids of the second stage, V604A,B, is fed to the control grids of the output tubes, V607 and V608, and the tone modulator tubes, V605A and V602A, through the NORM-REV switch, S603A.

The pulse appearing in the teletypewriter loop circuit must be an exact duplicate of the pulse appearing at the discriminator output to prevent loss of printing margin on the teletypewriter. The keyer unit is provided with a \%MARK control, R613, located in the cathode circuit of tube V602B; this permits adjustment of the operating bias of this tube to obtain linear amplification of the pulses appearing on its grid and thereby minimize distortion of these pulses.

This control is adjusted to give a symmetrical square wave in the teletypewriter loop circuit with the LOW-HI-ADJ switch in the ADJ position. The detailed procedure is given in Section 3, paragraph $7 a(20)$.

The output tubes, V607 and V608, obtain their plate voltage and current from an external power supply or battery through the teletypewriter loop and are controlled by the negative pulses received from the grids of the second trigger stage, V604A,B.

The common circuit of the screen grids (pins 6) of the two output tubes, V607, V608, includes an ON-OFF toggle switch, S604. When the teletype equipment is disconnected from the output tubes their plate voltage is removed. Under this condition the design and construction of the tubes is such that they will oscillate at about 200 mc . To prevent this, the switch S 604 must be opened when the teletypewriter is not used.

Certain operating requirements necessitate transmission of the keyed teletype pulses over telephone lines or radio relay links. The tone oscillator, V605B, and tone modulator, $V 605 \mathrm{~A}$, provide facilities for such transmission.

The tone oscillator tube, V605B, and its tuned circuits, L601 and C607 through C614, permit a choice of eight tone frequencies, namely 595,765 , $935,1105,1275,1445,1615$, and 1785 cycles per second. The output of the tone oscillator is fed through TONE LEVEL control, R629, to the tone modulator V605A. The tone modulator is keyed by the square-wave signal from trigger II tube. The output of the tone modulator is coupled through transformer T601 and tone output filter Z1101 to the TONE OUTPUT jack J1105 for connection to an external line and the PHONES jack J1402 for monitoring purposes. A balance modulator tube, V602A, balances out the transients resulting from square-wave signal currents. The MOD BAL control, R633, is adjusted for a minimum of transients as described in Section 3, paragraph 7a(19).

## 8. TUNING MONITOR UNIT.

See Schematic Diagram, Figure 7-32. The Tuning Monitor Unit is a direct-coupled oscilloscope which serves to indicate proper tuning of the associated radio receiver and to set the THRESHOLD control, R318, to its proper level.

The following tubes are used in the Tuning Monitor Unit:
schematic

| MBOL | tube trpe | circuit function |
| :---: | :---: | :---: |
| V701 | JAN-12AX7 | Vertical Amplifier |
| 702 | JAN-2BP1 | Cathode-ray |

When the associated radio receiver is tuned through the frequency range of the discriminator the average voltage from the discriminator will vary from a negative to a positive value. Since at the center of the discriminator characteristic the d-c component is zero, the discriminator voltage will indicate proper tuning of the radio receiver.

Intensity and focus voltages are provided by the - 600 -volt bleeder made up of R713 (the INTEN-

SITY control), R714, R715 (the FOCUS control), and R716. The arm of the INTENSITY control, R713, adjusts the bias on grid pin 2 of V702 to vary the brilliance of the pattern on the cathode-ray tube. Resistor R715 varies the voltage on pin 4 of V702 to focus the pattern on the screen. The heater leads of V702 are connected, through P701 pins 9 and 10, to a special 6.3 -volt winding on the power transformer in the Power Supply Unit. This is necessary because the cathode-ray tube operates at a cathode voltage of -600 volts to ground.

A sine-wave voltage for horizontal deflection is applied to pin 10 and is obtained from a tap on the power transformer T801, located in the Power Supply Unit, through pin 2 of P701. Pin 9 of the cathode-ray tube is grounded to complete the sinewave voltage circuit.

The d-c signal from the audio discriminator is applied to the VERT GAIN control, R701, through pin 14 of P701. The level of the grid signal of V701A is adjusted by R701 to provide a pattern of reasonable size. The output of V701A is cathode-coupled to V701B through R702. The output of V701B is directly coupled to the vertical plate, pin 6 of V702, through the CAL IN switch S701.

Control R705 applies a d-c voltage to the other vertical plate, pin 7, and is adjusted so that the amplifier tube V701B operates over the linear portion of its characteristic. Detailed adjustment procedure is given in Section 3, paragraph 7a(5) (e).

The V CENT control, R702, varies the vertical centering of the image on the cathode-ray tube. This control is in series with the cathode of V701A and a tap on the negative high-voltage bleeder. Therefore, the signal appearing on the arm of resistor R702 consists of the normal cathode signal and an adjustable negative d-c voltage depending on the setting of the control. When this signal is fed into the grid of V701B the adjustable d-c voltage controls the average voltage appearing on the plate and, in effect, controls the vertical centering of the pattern. The V CENT control is initially adjusted as explained in Section 3, paragraph 7a(5).

The THRESHOLD control, R318, is set to its proper level by comparing the voltage at the input of the clamping circuit (pin 6 of V601B in the Keyer Unit) against a pre-determined deflection of the cathode-ray tube which is marked by top and bottom lines engraved on the tube window. This procedure is given in detail in Section 3 paragraph $7 a(14)$. The CAL IN switch, when depressed, applies the clamping circuit voltage to the vertical plate of V702 to make this comparison.

# AN/URA-6, AN/URA-7 CV-57/URR <br> THEORY OF OPERATION 

## 9. POWER SUPPLY UNIT (for CV-57/URR).

See Schematic Diagram, Figure 7-28. The Power Supply Unit consists of a negative high-voltage supply for the cathode-ray tube, a regulated lowvoltage supply for critical circuits, an unregulated low-voltage supply, filament voltage supply for all tubes, and an a-c voltage supply to provide horizontal deflection voltage for the cathode-ray tube.

| SCHEMATIC |  |  |
| :---: | :---: | :---: |
| SYMBOL | TUBE TYPE | CIRCUIT FUNCTION |
| V801 | JAN-1Z2 | High-voltage Rectifier |
| V8 02 | JAN-6X4 | Low-voltage Rectifier |

| Ground | 13 | Return for D-C and 35 volt A-C voltages |

The high-voltage rectifier tube, V801, supplies -600 volts. Capacitors C801A,B,C and resistors R801, R802 filter this high-voltage supply. Resistors R803 and R805 form a voltage divider and bleeder with a - 45 volt tap. This bleeder also discharges the capacitors when the line voltage is turned off, should the load be disconnected.

The 200 -volt supply includes rectifier tube V802, filter capacitors C802A and B ( 35 microfarads each), and filter choke L801. Bleeder resistor R806 discharges the capacitors in case the load is disconnected.

Tube V803 regulates the 150 -volt supply, the current through the tube increasing or decreasing when the irput voltage rises or falls. The 200 -volt source feeds the regulator tube V803 through series resistor R804; variations in tube current change the voltage drop across this resistor to provide a reguJated output.

Resistor R807, in series with pin 11 of P801, limits the current through the neon B+indicator I1401, located on the Converter Chassis panel.

Input power to transformer T801 is fed through the power line filter Z1102 located in the Cable Filter Unit to suppress r-f noise.

Provision for $105-$, 115 - or 125 -volt nominal line voltages is made by a tapped primary brought out to terminals 2,3 , and 4 respectively; terminal 1 provides the connection for the other side of the line.

## 10. DUAL-CHANNEL FREQUENCY SHIFT CONVERTER-COMPARATOR GROUP AN/URA-6.

See Figure 2-2, Dual-Channel Equipment AN/-URA-6 Block Diagram. The dual-channel equipment has two Converter CV-57/URR units which operate from separate receivers, and a Comparator CM-14/URR unit.

The Comparator CM-14/URR takes the discriminator output voltage and the diversity control voltage from the two CV-57/URR units and, by electronic switching, selects the discriminator voltage from the channel supplying the stronger control signal. The selected discriminator voltage is then used to key the teletypewriter loop or provide a tone signal for transmission to a remote point.

The Comparator CM-14/URR (see Figure 2-3) includes the following operating sub-assemblies shown interconnected on the System Schematic, Figure 7-21:

|  | FIGURE <br> NUMBER | SYMBOL <br> SNRIT NAMES |
| :--- | :---: | :---: |
| Comparator Chassis | (SCHEMATIC <br> DIAGRAM) | Part of $7-21$ |

## 11. COMPARATOR CHASSIS ASSEMBLY (for CM-14/URR).

See Schematic Diagram, Figure 7-21. All connections to the Cable Filter Unit and the units on the Comparator Chassis are made by plugs and jacks. Plug P1601, mounted on the rear of the Comparator Chassis, engages with jack J1301 on the Cable Filter Unit when the Comparator Chassis is properly seated in the case. This permits all external cable connections, which are made to the Cable Filter Unit, to be carried into the chassis assembly cable and distributed to jacks J1603 and J1605 inclusive. These jacks, in turn, engage the proper sub-assembly plugs when these units are assembled in the Comparator Chassis. The other electrical items of the chassis, in addition to the jacks and cable, are the $B+$ indicator and socket I/X1601, the POWER OFF-ON switch S1601, the meter switch S1602, comparison meter M1601 and the TTYP and PHONES jacks J1601 and J1602.

The B+ "on" indicator is a neon lamp connected between ground and the 200 -volt supply, in series with a limiting resistor R1008 located in the power supply. The neon lamp glows to indicate that a voltage of 200 volts is present in the power supply.

The POWER OFF-ON switch makes or breaks both legs of the a-c line connecting into the power transformer primary. The TTYP jack, J1601, is in series with the external teletypewriter loop circuit and is used to meter the teletype current and otherwise monitor the loop circuit. The PHONES jack, J1602, is supplied with keyed tone output signals through the Tone Output Filter, Z1301, for monitoring purposes.

The CHANNEL A LEVEL-DIV IND-CHANNEL B LEVEL switch, S1602, connects the meter, M1601, to indicate the incoming signal level of either channel A or channel B or, in the DIV IND position, to show which channel is supplying the input to the Comparator Keyer Unit.

## 12. CABLE FILTER UNIT (for CM-14/URR).

Refer to Schematic Diagram, Figure 7-26. All external cable connections are made by jacks mounted on the rear of the Cable Filter Unit. These jacks and their functions are listed below together with the names with which they are designated on the equipment.

| SYMBOL No. | NAME | CIRCUITS |
| :---: | :---: | :---: |
| J1302 | EXT. TONE | External tone signal input |
|  | IN |  |
| J1303 | TONE | Tone output |
|  | OUTPUT |  |
| J1304 | TTYP | Teletype output |
|  | OUTPUT |  |
| J1305 | PWRINPUT | A-C power input |
| J1306 | PWR | A-C power output (paralleled |
|  | OUTPUT | with J1305 and J1307) |
| J1307 | PWR | A-C power output (paralleled |
|  | OUTPUT | with J1305 and J1306) |
| J1308 | DIV-CONT | Diversity control voltage |
|  | CHAN-A | channel A |
| J1309 | DIV-CONT | Diversity control voltage |
|  | CHAN-B | channel B |
| J1310 | DIV-SIG | Diversity signal input channel |
|  | CHAN-A | A |
| J1311 | DIV-SIG | Diversity signal input channel |
|  | CHAN-r | B |

Electrical connections from these jacks to the various sub-assembly units on the Comparator Chassis are made through jack J1301. This jack is mounted on the lower right-hand of the inside panel and engages plug P1601 mounted on the Comparator Chassis.

The equipment is protected from overload by two three-ampere fuses, F1301 and F1302, each in series with one leg of the line. The fuses do not protect circuits to the Converters, through jacks J1306 and J1307. These circuits are fused in the individual Converters.

A power line filter, $\mathbf{Z 1 3 0 2}$, is inserted in the power line in series with the power transformer primary. This filter has an attenuation of at least 65 db from 14 kc to 10 mc and at least 50 db from 10 mc to 30 mc when fully loaded. It prevents any signals generated in the equipment from entering the line and also prevents external signals from entering the equipment.

A tone output filter, Z1301, is inserted in series with the tone output from the Keyer Unit. It has the same attenuation and purpose as the power line filter just described. The output connections of the tone filter are taken to the PHONES jack, J1602, for monitoring purposes.

The tone output impedance is 600 ohms nominal from 595 to 1785 cycles with a power output of at least 12 milliwatts across a 600 -ohm non-inductive load. The output circuit has its center tap brought out to terminal B of the Tone Output jack J1303 and may be grounded if required by external conditions.

RESTRICTED
NAVSHIPS 91355

AN/URA-6, AN/URA-7<br>CV-57/URR<br>THEORY OF OPERATION

A fan, B1301, operates from the 115 -volt power line. Capacitor C1301 provides the necessary phase shift to operate the fan motor. The fan maintains an even temperature distribution when the equipment is in use.

## 13. DIVERSITY SELECTOR UNIT.

See Schematic Diagram, Figure 7-44. The Diversity Selector Unit compares the channel $A$ and channel $B$ diversity control signals and permits the stronger signal to operate the gating circuit which switches the discriminator output of either channel A or channel B Converters to the input of the Keyer Unit. The following tubes are used in the Diversity Selector Unit:

| SCHEMATIC SYMBOL | tUBE TYPE | CIRCUIT FUNCTION |
| :---: | :---: | :---: |
| V901 | JAN-6AU6 | Channel A Amplifier |
| V902 | JAN-6AL5 | AVC and Differential Rectifier Channel A |
| V903 | JAN-6C4 | D-C Amplifier |
| V904 | JAN-12AUT | First Control Trigger |
| V905 | JAN-12AU7 | Second Control Trigger |
| V906 | JAN-12AU7 | Gate B and Gate B Control |
| V907 | JAN-12AU7 | Gate $A$ and Gate A Control |
| V908 | JAN-6AU6 | Channel B Amplifier |
| V909 | JAN-6AL5 | AVC and Differential Rectifier Channel B |

The diversity control signal from channel $A$ is amplified by V901 and its output is rectified negatively by a diode, pins 5 and 2 of V902. The diversity control signal from channel $B$ is amplified by V908 and its output is rectified positively by a diode, pins 5 and 2 of V909. The two rectified outputs are combined across resistors $\mathbf{R 9 3 1}$ and $\mathbf{R 9 3 2}$ which form a differential rectifier circuit, the output of which is used to control the gating circuits. A negative voltage at the junction of R931 and R932 indicates channel A signal is the stronger. Conversely, a positive voltage indicates a reverse condition.

A portion of the output appearing at the plate of V901 and a portion of the output of V908 are rectified negatively by two diodes, pins 1 and 7 of V902 and pins 1 and 7 of V909. The outputs of these diodes are combined across a common load resistor R947 and returned to both grids through R902, R941, and R942. This voltage provides AVC control which extends the operating range of the amplifier tubes to accommodate approximately 50 db input range of signal amplitude.

The output of the differential rectifier which appears at the junction of resistors R931 and R932 is fed to the grid of the d-c amplifier tube V903 through links O901 and O902 and the CHANNEL

A-COMBINED-CHANNEL B switch S901. Since the Comparator CM-14/URR is designed for use with either a-f or i-f type Converters, the links O901 and O902 permit connection to a twin-T network for the a-f type Converter or filter capacitor C909 for the i-f type Converter. This adjustment is made at the time of installation.
(The twin-T network is a low-pass filter having its maximum attenuation at 100 cycles; it removes the 1000- or 2550-cycle component which may be present in the signal supplied by the Audio Input Unit of the a-f type Converter. This network is not operative in the equipment discussed in the present instruction book, being disconnected by links O901, O902.)

The CHANNEL A-COMBINED-CHANNEL B switch S901 permits single-channel operation from channel $A$ or channel $B$ or diversity operation from both channels. In the CHANNEL A position it applies a fixed negative voltage to the grid of V903 to hold this tube in non-conducting condition. In the CHANNEL B position it applies a fixed positive voltage to the V903 grid to hold this tube in a conducting condition. In the combined position the switch applies the output voltage of the differential rectifier to operate V903 in the normal manner.

The Control Balance resistor, R905, permits the gating circuits to switch channels with an equal change of input level for either channel. This adjustment is explained in detail in Section 3, paragraph $7 c(11)$.

The output of V903 is direct-coupled to an EcclesJordan flip-flop stage, V904, which in turn is capacitively coupled to another Eccles-Jordan flip-flop stage, V905, having two stable positions. The output, taken from the grids of the second stage, V905, is fed to the control grids of the gate-A control tube, V907, and the gate-B control tube, V906.

The gate circuits consist of a control tube in series with a gate tube for each of the two channels. The discriminator outputs of channels $A$ and $B$ are fed to grids (pin 2) of the gate tubes V907 and V906, respectively.

When the grid (pin 7) of V907 receives a positive voltage from V905, current flows through the cathode resistors R921 and R946, impressing a voltage on the plate (pin 1) of V907 and permitting the input signal on the grid ( $\operatorname{pin} 2$ ) of this tube to appear across the cathode resistor R926. When a positive voltage appears on the gate-A control tube, V907 pin 7 , a negative voltage appears on the gate- $B$ control tube, V906, pin 7. Such a condition stops the flow of current through cathode resistors R923,

R922, and R945, resulting in no plate voltage on gate-B. Since no plate current can flow, the signal on the input grid cannot appear across the common cathode resistor R926.

When the channel B input signal level exceeds the channel A signal level the polarities on the gate control grids are reversed and the opposite condition exists on the gate tubes. The outputs of the two gate tubes, combined across cathode load resistor R926, are then fed to the input of the Keyer Unit.

The GATE BAL control, R923, varies the plate voltage on pin 1 of V906 to compensate for differences in gain of the two gate tubes. When properly balanced the switched plate voltage pulse created by the switching action of the control tubes is effectively cancelled in the common cathode resistor R926. Adjustment is explained in detail in Section 3, paragraph $7 c(10)$.

The CHANNEL A LEVEL-DIV IND-CHANNEL B LEVEL switch, S1602, connects the meter, M1601, to indicate the incoming signal level of either channel A or channel B or, in the DIV IND position, to show which channel is supplying the input to the Comparator Keyer Unit. In the CHANNEL A position the meter is inserted in series with the cathode resistor, R948, of the AVC rectifier V902. A similar connection to V909 is made when the switch is in the CHANEL B position. The current reading of the meter is therefore proportional to the voltage appearing across its respective differential rectifier. Further use of the meter is explained in Section 4, paragraph $5 e$. In the DIV IND position the meter is inserted across the resistors R944, R945, and R946 to indicate which of the gate tubes, V906 and V907, has voltage on its plate and is therefore conducting. A reading to the left of center indicates channel $A$ is conducting and a reading to the right indicates channel $B$ is conducting.

## 14. KEYER UNIT.

The Keyer Unit receives the d-c pulses from either channel A or channel B discriminator through jack J1310 or J1311 depending on which channel is selected by the Diversity Selector Unit. The selected pulses are then used to key the teletypewriter loop circuit and to key on and off a tone oscillator for transmission to a remote point. The detailed theory of the Keyer Unit is given in paragraph 7 of this section, since the Keyer Units used on the Comparator and on the Converter are interchangeable.

## 15. POWER SUPPLY UNIT (for CM-14/URR).

See Schematic Diagram, Figure 7-30. The Power Supply Unit consists of a negative-voltage supply for bias voltages, a regulated d-c voltage supply for critical circuits, an unregulated d-c voltage supply and a filament voltage supply for all the tubes.

The tubes used in the Power Supply Unit are as follows:

| SCHEMATIC SYMBOL | TUBE TYPE | CIRCUIT FUNCTION |
| :---: | :---: | :---: |
| V1001 | JAN-1Z2 | Negative Voltage Rectifier |
| V1002 | JAN-6X4 | Positive Voltage Rectifier |
| V1003 | JAN-0A2 | Voltage Regulator |
| Connections to P1001 are as follows: |  |  |
| VOLTAGE | PIOO1 PIN NUMBER | SERVICE |
| 105,115,125 | 12 and 14 | A-C input |
| A-C |  |  |
| 115 A-C | 5 | Fan supply |
| 6.3 A.C | 1 and 7 | Heaters of all tubes except negative voltage rectifier, V1001 |
| $+200 \mathrm{D}-\mathrm{C}$ | 2 | General plate voltage supply |
| +150 D-C | 3 | Tone Oscillator and Audio Amplifier plate voltage in Keyer Unit |
| -130 D-C | 8 | Trigger and gate bias in Di versity Selector Unit |
| -45 D-C | 4 | Bias for trigger and teletype keyer tubes in Keyer Unit |
| $\begin{gathered} +80 \mathrm{D}-\mathrm{C} \\ \text { (nominal) } \end{gathered}$ | 11 | Voltage for neon $B+$ indicator, 11601 |
| Ground | 13 | Return for D-C voltages |

The negative-voltage rectifier tube, V1001, supplies -130 and -45 volts. Capacitors C1001A,B,C and resistors R1001, R1002 filter the negative voltage supply. Resistors R1003 and R1005 form a voltage divider and bleeder with a - 45 volt tap. They also discharge the capacitors when the line voltage is turned off, should the load be disconnected.

The 200-volt supply includes rectifier tube V1002, filter capacitors $C 1002$ A and $B(35$ microfarads each), and filter choke L1001. Bleeder resistor R1006 discharges the capacitors in case the load is disconnected.

Tube V1003 regulates the 150 -volt supply, the current through the tube increasing or decreasing when the input voltage rises or falls. The 200 -volt source feeds the regulator tube V1003 through the series resistors R1004 and R1007. Variations in tube current change the voltage drop across these resistors to provide a regulated output.

Resistor R1008, in series with pin 11 of P1001, limits the current through the neon $B+$ indicator [1601, located on the Comparator Chassis panel.

RESTRICTED
NAVSHIPS 91355

Input power to transformer T1001 is fed through the power line filter $\mathbf{Z 1 3 0 2}$, located in the Cable Filter, to suppress r-f noise.

Provision for 105-, 115-, or 125-volt nominal line voltages is made by a tapped primary brought out to terminals 2,3 , and 4 respectively; terminal 1 provides the connection for the othet side of the line.

## 16. DUAL-CHANNEL FREQUENCY SHIFT CONVERTERCOMPARATOR GROUP AN/URA-7.

Frequency Shift Converter-Comparator Group AN/URA-7 includes two Frequency Shift Converters CV-71/URR and one Comparator CM-14/URR. Thus it differs from Frequency Shift Con-verter-Comparator Group AN/URA-6 in that it utilizes CV-71/URR Converters in place of CV-57/URR Converters and that no Receiver Coupling Kit is used with the AN/URA-7 equipment. The arrangement of the Converters and Comparator is the same in both the AN/URA-6 and AN/URA-7 equipments and is illustrated in the Block Diagram, Figure 2-2.

## 17. FREQUENCY SHIFT CONVERTER CV-71/URR.

The only difference between Frequency Shift Converter CV-71/URR and Frequency Shift Converter CV-57/URR is that the input signal frequency for the former is from 47.5 to 52.5 kc while the input frequency for the latter is from 395 to 470 kc . Circuit-wise, the difference between the two Converter models is in the Input Unit, which is described in the following paragraph. For a discussion of the other units refer to the appropriate preceding paragraphs of this section. The Block Diagram of Figure 2-1 applies to both Converter models.

## 18. INPUT UNIT (for CV-71/URR).

See Schematic Diagram, Figure 7-34. Essentially, the Input Unit of the CV-71/URR Converter differs from that of the CV-57/URR Converter (described in paragraph 5 of this section) in that certain circuit component values have been changed in view of the different operating frequency, as mentioned in the preceding paragraph. While the circuit components in the Input Unit of the CV-57/URR equipment are designated by symbols in the 100 -series, those in the Input Unit of the CV-71/URR bear symbols in the 200-series.

The following tubes are used in the Input Unit of the CV-71/URR Converter;

| SCHEMATIC |  |  |
| :---: | :--- | :--- |
| SYMBOL | TUBE TYPE | CIRCUIT FUNCTION |
| V201 | JAN-6C4 | Oscillator |
| V202 | JAN-6AU6 | Automatic Frequency Control <br>  <br>  <br> V203 |
|  | JANC) |  |

The signal is fed from the receiver to the Converter through the Cable Filter Unit and plug P201 to the junction of capacitors C211, C212 of the Input Unit. These capacitors tune the primary of transformer T202 and provide proper impedance match. Additional selectivity is provided by transformers T202, T203 and associated capacitors.

A characteristic is thereby obtained, such that the circuit bandwidth at 50 kc center frequency is not more than 2.4 kc at 6 db down; and not more than 11 kc at 60 db down.

The equipment is adjusted between 47.5 and 52.5 kc by adjusting the powdered-iron cores of the transformer windings.

The converted signal appears at the plate of tube V203 and is fed to the input of the I-F Unit through plug P201.

The oscillator tuned circuit, T201, is bridged by fixed capacitors C204, C219 and is adjusted to a frequency of 47.5 to 52.5 kc by a powdered-iron core. External tuning of the circuit over a narrow range is done by C205, a variable capacitor used as a vernier.

The plate circuit of the automatic frequency control tube, V202, appears as a variable reactance across the oscillator tank circuit to tune the oscillator over a small range. The reactance presented by the tube is dependent on the transconductance, which is controlled by the afc bias from the discriminator. This bias is obtained from the I-F Unit through pin 11 of P201 and filtered by resistors R203, R204, R205 and capacitor C208.

## 19. RECEIVER COUPLING KIT, TYPE 10563.

As stated in Section 1, the Receiver Coupling Kit, Type 10563 includes a Cathode-follower Assembly and a Low-pass Filter Unit. These are described below with reference to the Schematic Diagram, Figure 7-40.

Only one tube, V501, is used, a type JAN-6AB7.
a. CATHODE-FOLLOWER ASSEMBLY.-The

Cathode-follower Assembly is an L-shaped bracket with a terminal board and socket for mounting the
component parts. A switch, $\mathbf{S 5 0 1}$, in the heater circuit turns the unit off and on. The tube, V501, gets its heater and plate power from the receiver in which it is installed. Operating as a cathode follower, the tube grid (pin 4) signal is supplied by the plate circuit of the third i-f stage in the associated Navy Model RBB, RBC, or RDM Receiver through a 100 micromicrofarad d-c blocking capacitor, C501. The output is taken from the cathode (pin 5) through a 0.01 microfarad capacitor. Resistor $\mathbf{R} 501$ is the load and bias resistor. Plate (pin 8) and screen grid (pin 6) voltage is obtained from the radio receiver +200 -volt supply through resistor $\mathbf{R} 502$. Capacitor C503 bypasses the signal voltage which appears in the plate circuit, to ground.
b. LOW-PASS FILTER UNIT.-The Low-pass Filter consists of a coil and capacitor assembly with a shield can and an output jack, J501. The filter is
mounted on the rear shield of the radio receiver and is connected to the Cathode-follower Assembly by a shielded single-conductor cable covered with an insulating braid. The filter includes two series-connected coils with a capacitor connected from each coil terminal to ground. A grounded shield separates the two coils. The mounting bracket holes match the output jack so that the jack mounting screws also support the Low-pass Filter Unit. An overall shield mounts on the radio receiver.

The Low-pass Filter unit passes frequencies below 550 kc with very little attenuation. The attenuation increases with frequency above 550 kc .

The output impedance of the filter is approximately 70 ohms.

A one-volt $400-\mathrm{kc}$ signal at the input of the cathode follower will produce a signal of 0.1 to 0.3 volt across a $\mathbf{7 0}$-ohm resistor at the filter output.

## I. UNPACKING.

## CAUTION

## THE EQUIPMENT IS SUPPLIED WITH THE CHASSIS INSTALLED IN THE CABINET AND THE ELECTRON TUBES IN PLACE. IT IS THEREFORE VERY IMPORTANT THAT ALL MECHANICAL SHOCKS BE AVOIDED WHEN UNPACKING AND INSTALLING THE EQUIP. MENT IN ORDER NOT TO DAMAGE ANY PART.

The following special precautions should be observed:

Keep boxes and crates containing equipment in an upright position at all times.

Observe the weights marked on the boxes and make certain that appropriate lifting and transporting gear is available to handle the equipment without subjecting it to shock or damage.

Remove at least three sides from the boxes or crates with a nail puller. Do not use a hammer or pinch bar for this purpose.

## 2. INSTALLATION, GENERAL.

The various pieces of equipment making up the complete system should be arranged for convenience of operation and accessibility for maintenance. Allow front clearance for tuning and maintenance and rear clearance for connection plugs and cables to the Cable Filter Units. See Figure 3-21 for clearance dimensions of the CV-57/URR and Figures 3-22 and 3-23 for clearance dimensions of the $A N /-$ URA-6 and AN/URA-7 equipments. Observe tilt-
ing clearances shown on drawing, for equipment that may be installed in the relay rack above or below.

Receiver Coupling Kits, Type 10563, are supplied one with the CV-57/URR and two with the AN/-URA-6 equipment, for installation in the associated radio receiver to provide low-impedance i-f coupling between the radio receiver and Converter. The Filter Unit in the Receiver Coupling Kit passes frequencies of $400 \mathrm{kc} \pm 100 \mathrm{kc}$.

## CAUTION

The equipment frame should be securely grounded to insure best performance and eliminate possibility of electric shock to personnel.

## 3. INSTALLATION OF RECEIVER COUPLING KIT IN RBB OR RBC RECEIVER.

a. REMOVAL OF RBB/RBC CHASSIS FROM CABINET.-Remove the RBB-RBC chassis from its cabinet in the following manner:
(1) Disconnect the antenna, audio output and interconnecting cable plugs from their receptacles at the rear of the radio receiver.
(2) Loosen the twelve panel thumb screws by turning them approximately six turns. These thumb screws are of the captive type and do not release entirely.
(3) Grasp the two round knobs located on the front of the receiver and pull the chassis out part way, until the stops strike. These stops may be released by pressing them through the holes on both sides, near the bottom.
(4) Pull the chassis completely out and set it on a level surface.

RESTRICTED<br>NAVSHIPS 91355

Figure 3-1. Audio Filter Coil (L304A,B) Mounting on RBB/RBC Receivers
b. REMOVAL OF AUDIO FILTER COIL AND CONNECTOR ASSEMBLY.-Remove the audio filter coil, L304-A,B, and connector assembly, J302, in the following manner: (See Figure 3-1).
(1) Remove retaining nut.
(2) Remove the grounding spring.
(3) Remove the outside insulating washer.
(4) Remove shield can screws and brackets.
(5) Remove audio filter coil, connector assembly, and inside insulating washer. NOTE: It is not necessary to unsolder any wires.
c. CHASSIS DRILLING.-See Figure 3-2.
(1) Cut out template No. 1 (item 6 of Table 1-1) with a razor or some sharp instrument. Hold the template in place against the rear of the RBB or RBC radio receiver chassis with scotch tape, friction tape, etc. See Figure 3-2A.
(2) Mark off the position of the seven additional holes by means of a center punch.
(3) Drill the holes in the back of the chassis frame as shown in Figure 3-2A. NOTE: Use a small drill (\#47 Drill, 0.078 -inch diameter) before drilling the finished (correct) size of the 0.187 -inch diameter holes.
(4) Cut out template No. 2. Remove the ground terminal and drill the three additional (0.187inch diameter) holes. See Figure 3-2B.
(5) Drill an additional 0.187 -inch hole, $3 / 4$ inch toward the front and $1 / 2$ inch to the left of the front left hole drilled in step 4. See Figure 3-2B.
d. CABINET DRILLING.-See Figure 3-3.
(1) Cut out template No. 3. See Figure 3-3.
(2) Drill the additional (one-inch diameter) hole.
(3) Remove the paint on the inside and outside of the cabinet as shown on Figure 3-3.
e. AUDIO FILTER MOUNTING.-Remount the Audio Filter Coil, L304A,B, and Connector Assembly, J302, in their new positions as shown in Figure 3-1. Use the same mounting hardware (brackets, nuts, etc.) as were used for the original mounting.
f. LOW-PASS FILTER UNIT MOUNTING.-See Figure 3-4 and see Table 1-1 for item references.
(1) Connect lead "D" (item 4-J) on Receptacles J501 (item 3D) as shown in Figure 3-4. Assemble the four insulating washers (item 4-D), grounding spring (item $3 G$ ), receptacle (item 3D), insulating board (item 3C), coil assembly (item 2), four lockwashers (item 4G), and four screws (item 4C) as shown in Figure 3-4. Add spaghetti (item $4 K$ ) over lead " $D$ " and connect to terminals of coil assembly.
(2) Place the shield can (item 3A) over the above assembly.
(3) Fasten the shield can assembly (item 3A) to the chassis frame by two lock washers (item 4H), two nuts (item 41), and two screws (item 4A).
(4) Place the shield can cover (item 3B) in position. Note: The cable "C" (see Figure 3-5) should be fed through the side hole.
(5) Place the decalcomanias in position as shown in Figure 3-2A.

REMOVE PAINT ON OUTSIDE OF CABINET WITHIN THESE AREAS

Figure 3-4. Low-Pass Filter Unit Mounting
g. CATHODE-FOLLOWER ASSEMBLY MOUNT-ING.-See Figure 3-5 and see Table 1-1 for item references.
(1) Mount the Cathode-Follower Assembly in position as shown in Figure 3-5.
(2) Fasten this assembly to the chassis by means of the four screws (item 4B) and four lock washers (item 4H). NOTE: Be sure to put the ground terminal in place as shown in Figure 3-5.
b. WIRING.-See Figures 3-5 and 7-41 and see Table 1-1 for item references.
(1) Connect lead "A" (part of item 1) to the Third I-F, X303, plate pin 8 (see Figure 3-5).
(2) Connect cable "B" (item 3H) to TB307. The white lead with red tracer is connected to terminal No. 7 and the white lead with brown tracer is connected to terminal No. 5.
(3) Connect cable "C" (part of item 2) to TB501, terminal No. 1, located on the CathodeFollower Assembly.
(4) Turn S 501 to ON and replace the receiver in the cabinet.

Figure 3-5. Receiver Coupling Kit Installation on RBB/RBC Receivers

## 4. INSTALLATION OF RECEIVER COUPLING KIT IN RDM RECEIVER.

a. CHASSIS DRILLING.-See Table 1-1 for items referenced in the following steps $a$ to $j$.
(1) Cut out the templates (item 10) with a razor or some sharp instrument. Hold the templates in place against the RDM receiver chassis with scotch tape or friction tape. See Figure 3-6 for the template locations, one being placed on right side of chassis, the other on rear apron of chassis.
(2) Mark the positions of the new holes by means of a center punch.
(3) Drill the new holes with a 0.187 -inch drill.
(4) Drill a $1 / 4$-inch hole close to the right apron between sockets $X 9$ and $X 10$, as shown on Figure 3-8.
b. Mount the Tube Shelf Assembly (item 1) on the Side Bracket (item 8-B), using the 6-32 x 3/8 screws (item 4B) and the number 6 lock washers (item 4-H) supplied. Because of the position of the mounting spacers, the Tube Shelf will only fit one way. See Figure 3-6 for position.
c. Mount the Side Bracket on the receiver sideapron, using two $10-32 \times 3 / 8$ screws (item 7A) No. 10 lock washers (item 7C), and No. 10 nuts (item 7E).
d. Mount the Receptacle (item 3D) on the Coil Assembly, using four 4-32 $\times 7 / 16$ binder-head screws (item 4C). Slide the spaghetti (item 4K) over the conductor (item 4J) and solder between coil terminal and receptacle (see Figure 3-4). Do not use the Insulating Board (item 3C) or the Insulating Washers (item 4D).
e. Slide the Coil Assembly in the Shield Can (item 3A) and fasten the complete assembly to the Rear

Bracket (item 8A) using two 6-32 screws (item 4A), two lock washers (item 4H), two 6-32 nuts (item 4I), and two spacers (item 7C).
$f$. Mount the Rear Bracket on the receiver rearapron, using three 6-32 screws (item 7B), and lock washers (item 7E). See Figures 3-6 and 3-7.
g. Crimp and solder center conductor of cable (item 9A) to terminal A of Coil Assembly. Solder shield pigtail to terminal B.
$b$. Solder center conductor at other end of above cable to terminal 1 of TB501 on Tube Shelf Assembly. See Figure 3-7.
i. Install power cable (item 3 H ) as follows:
(1) At longer lead end, strip back the braid six inches.
(2) Crimp and solder red-tracer lead at other end of cable to terminal 3 of TB501 on the Tube Shelf.
(3) Crimp and solder brown-tracer lead to terminal 2 of TB501 on Tube Shelf.
(4) Push leads through $1 / 4$-inch hole near X9 and $X 10$.
(5) Crimp and solder brown-tracer lead to pin 7 of X10. See Figure 3-8.
(6) Crimp and solder red-tracer lead to terminal 9 of TB3. See Figure 3-8.
j. Install signal cable (item 9B) as follows:
(1) Crimp and solder cable to TP1 on Tube Shelf Assembly (see Figure 7-41). Remove short lead if necessary.
(2) Slide sleeving (item 9C) over cable.
(3) Put cable through hole made by punching as shown at G16 in Figures 3-8 and 3-9.
(4) Crimp and solder cable to pin 8 of X6.
k. Check to assure switch S 501 is in ON position and replace receiver in cabinet,

Figure 3-7. Receiver Coupling Kit Installation on RDM Receiver, Top View

AN/URA-6, AN/URA-7 CV-57/URR INSTALLATION

## 5. INSTALLATION OF FREQUENCY SHIFT CONVERTER CV-57/URR.

a. RACK MOUNTING.-Place the equipment on a bench; place the rack mounts (see Figure 1-2), identified as (C) and (D) in Table 1-1, against the cabinet sides so the slotted flanges turn outward, parallel to the front panel, and fasten each in place with nine No. $8-32 \times 3 / 8$ screws supplied. Put lock washers under the screw heads. See Figure 3-22 for further information. Refer to Figure 3-23 for tilting clearances to avoid interference with other equipment that may be located above or below. Mount the cabinet in the rack, using rack screws and washers (not supplied).
b. TABLE MOUNTING. - Assemble the shock mount first. Proceed as follows:
(1) Assemble the shock mounts, (F) of Table 1-1, two each on the bracket assemblies, (A) and (B) Table 1-1, using $1 / 4-20$ screws, lock washers and nuts supplied (see Figure 3-22). Put the lock
washers under the nuts.
(2) Attach the above two assemblies to the channel, (E) of Table 1-1, using eight No. 8-32 $x$ $3 / 8$ screws. Put flat washers and lock washers under the screws, with the lock washers next to the screws.
(3) Turn the case upside down and put shock mount assembly in place.
(4) Fasten shock mount in place with nine No. $8-32 \times 3 / 8$ screws and lock washers on each side of cabinet.
(5) Drill the four mounting holes in the table for 5/16-inch diameter bolts (not supplied): Two holes with centers 14 inches apart for the front shock mounts, and two holes with their centers $7-5 / 8$ inches to the rear of the front bolt hole centers.
(6) Turn the equipment to rest on the shock mounts and bolt to the table with $5 / 16$-inch bolts. Table 3-1 shows a listing of external connectors and related information. Figure 3-10 is a rear view of Converter CV-57/URR showing the locations of these connectors.

| P1111 | 49195 | Center and shell | I-F Input plug |

* Used for dual-channel operaton only. See Table 3-2.

## c. CONNECTING CABLES.

(1) GENERAL. - Connections to the equipment vary with different installations. In each case the equipment should be installed in accordance with approved installation plans which will show where to install it and the types of cables to be used.

Length and termination of connecting cables depend on the installation. The equipment is delivered with the mating plugs (and their associated cable clamps and ferrules) connected to their corresponding receptacles (jacks) on the unit. Remove each plug, one at a time, when it is ready for cable
fabrication. For coaxial cable fabrication refer to Figure 3-11.

For multi-conductor cable fabrication refer to Figure 3-12. To disassemble the plug, first unscrew its associated cable clamp on the back of the plug. Be careful not to lose the ferrule seated inside the cable clamp, between the clamp and plug. Refer to Figure 3-12 for further details.
(2) POWER CABLE. - Remove plug P1108 from PWR INPUT jack J1108, disassemble and, using a two-wire power cable, solder the wires to pins $A$ and C. Reassemble the plug and replace on PWR INPUT jack J1108.

Figure 3-10. Frequency Shift Converfer CV-57/URR, Rear View

APPLY ELECTRICAL insulating VARNISH* UNDER HEAD OF SCREW

* NAVY SPEC 52-V-13 GRADE CA STANDARD NAVY STOCK NO. 52-V-1240

CONDUCTOR
DIELECTRIC

OUTER GOVERING

1. Unscrew cable clamp from plug, being careful not to lose ferrule, rubber washer, and fibre gasket.
2. Remove cable clamp cap by unfastening the two clamp screws.
3. Slip cable through cable clamp, fibre gasket, and rubber washer, the threaded portion of clamp being towards the end of cable.
4. Disassemble plug for soldering wires by unscrewing its back shell. Slip the cable through back shell and the plug coupling ring, which is freed when the back shell is removed.
5. Cut and strip cable and wires to suit. Pre-tin each wire. Cut back the shielding to within one-half inch of the outer covering.
6. Pre-tin braided shielding of cable.
7. Solder wires to plug contacts. Avoid excessive solder.
8. Reassemble plug. The cable shielding should show about one-quarter inch beyond the assembled plug.
9. Slip ferrule over cable so that shielding is on side that will be within connector housing. Solder shielding to ferrule, not permitting any solder to get near outer edge of ferrule as this causes a barrier between ferrule and rim of connector shell.
10. Push the cable in so that the ferrule is up against the connector shell rim, position the clamp rubber washer and fibre gasket, and then screw the cable clamp body onto the back shell of plug.
11. Reassemble the cable clamp cap with the two associated clamp screws and lock washers.

Figure 3-12. Cable Fabrication Instructions, Multi-Conductor Cable
(3) TELETYPEWRITER OUTPUT CABLE.Remove plug P1106 from TTYP OUTPUT jack J1106, disassemble and, using two-wire cable, connect leads to $A$ and $B$. Note that pin $B$ is grounded inside the Converter. If using single-conductor shielded wire, solder conductor to $A$ and shield to $B$. Reassemble plug and replace on T'TYP OUTPUT jack J1106. The teletypewriter loop current must be supplied from external teletype battery or power supply. The negative side of the teletypewriter loop is grounded in the Frequency Shift Converter CV57/URR. See Figure 3-13.
(4) SIGNAL INPUT (I-F INPUT) PLUG P1111.-Remove plug from I-F INPUT jack J1111 and disassemble. Using 70 -ohm coaxial cable, solder the center conductor to the plug center, and the shield to the plug shell. Reassemble plug and engage in jack. The other end of the cable goes to the associated receiver by way of Receiver-Coupling Kit, Navy type 10563.
(5) TONE OUTPUT CABLE.-Remove plug P1105 from the TONE OUTPUT J1105 and disassemble. If two-wire or single-wire shielded cable is used, solder leads to $A$ and $C$. Pin $B$ is the center tap of the output transformer and should be used only when a balanced grounded output is required. Reassemble plug and replace on TONE OUTPUT jack J1105. Connect a short length of bus wire from pin B of TONE OUTPUT jack J1105 to GND 5 (see Figure 7-25) if a ground is necessary.
(6) EXTERNAL TONE INPUT CABLE (IF USED).-Remove plug P1104 from the EXT. TONE IN jack J1104. If two-wire or single-wire shielded cable is used, solder leads to $A$ and $B$. Terminals $A$ and C of jack J1104 are connected together. Terminal B of J1104 is connected to the shield and ground. Reassemble plug and insert in jack J1104. Use of this cable is optional.
(7) VERTICAL CRT REMOTE CABLE (IF USED).-Remove plug P1102 from the VERT. CRT-REMOTE jack J1102. Using 70 -ohm coaxial or single-wire shielded cable, solder the center conductor to the plug center, and the shield to the plug shell. Reassemble plug and insert in jack J1102. Use of this cable is optional.

Figure 3-13. Telefypewriter Loop Circuit,
Block Diagram

## 6. INSTALLATION OF FREQUENCY SHIFT CONVERTER-COMPARATOR GROUP AN/URA-6 or AN/URA-7.

a. MOUNTING. - The AN/URA-6 or AN/-URA-7 equipment is supplied in a rack for table mounting. Four holes are provided in the base to bolt the rack to the table with $3 / 8$-inch bolts (not supplied), see Figure 3-22. The centers of the front holes are 15-1/2 inches apart, located $1-11 / 16$ inches back from the front of the cabinet. The centers of the rear holes are 11-1/16 inches directly to the rear of the centers of the front holes.

Access to the two front bolt holes can be had by removing the four screws holding the bottom Converter in the cabinet and then removing the Converter. After bolting the cabinet to the table, replace the Converter previously removed.

The Converters and Comparator can be removed from the table-mounting rack and installed in a standard relay rack. This is shown in Figure 3-23. The units may be fastened to the relay rack by the same screws as are used in the table-mounting rack. Spaces between the units may be covered by blank panels, each being held by two screws (one at each end). These panels and their screws are not supplied as parts of the subject equipment and must be procured separately. Observe the clearances shown on the drawing to allow for pulling out the chassis and tilting them for servicing, in order to avoid interference with other equipment that may be mounted in the relay rack above or below the units of the AN/URA-6 or AN/URA-7 equipments.

## b. CONNECTING CABLES.

(1) GENERAL.-Connections to the equipment vary with different installations. In each case the equipment should be installed in accordance with approved installation plans which will show where to install it and the types of cables to be used.

The equipment is delivered with the mating plugs (and their associated cable clamps and ferrules) connected to their corresponding receptacles (jacks) on the unit. Remove each plug, one at a time, when it is ready for cable fabrication. For single-conductor cable fabrication refer to Figure 3-11 and Table 1-2. For multi-conductor cable fabrication refer to Figure 3-12. To disassemble the plug, first unscrew its associated cable clamp on the back of the plug. Be careful not to lose the ferrule seated inside the cable clamp, between the clamp and plug. Refer to Figure 3-12 for further details.
(2) CONVERTER-TO-COMPARATOR CABLES.-Connect the six cables supplied with the equipment (Figure 3-14) as follows: (The first cable symbol number given is for the AN/URA-6 equipment; the symbol number in parentheses is for the AN/URA-7 equipment):
(a) Cable W1703 (W1701) from DIV. CONT. jack J1109 of top converter to DIV.-CONT. CHAN-A jack J1308 of Comparator.
(b) Cable W1704 (W1702) from DIV. CONT. jack J1109 of bottom converter to DIV.CON'T. CHAN-B jack J1309 of Comparator.
(c) Cable W1709 (W 1707) from DIV. SIG. jack J1110 of top converter to DIV.-SIG. CHAN-A jack J1310 of Comparator.
(d) Cable W1710 (W1708) from DIV. SIG. jack J1110 of bottom converter to DIV.-SIG. CHANB jack J1311 of Comparator.
(e) Cable W1715 (W1713) from PWR INPUT jack J1108 of top converter to PWR OUTPUT jack J1306 of Comparator.
( $f$ ) Cable W1716 (W1714) from PWR INPUT jack J1108 of bottom converter to PWR OUTPUT jack J1307 of Comparator.
(3) POWER CABLE. - Remove plug P1305 from PWR INPUT jack J1305, disassemble and, using a two-wire power cable, solder the wires to pins $A$ and $C$. Reassemble the plug and replace on PWR INPUT' jack J1305.
(4) TELETYPEWRITER CABLE. - Remove plug P1304 from TTYP OUTPUT jack J1304, disassemble, and using two-wire cable, solder leads to $A$ and $B$ as shown in Figure 3-12. The teletypewriter loop current must be supplied from external teletype power supply as shown in applicable installation drawing. The negative side of the teletypewriter loop is grounded in the Frequency Shift Converter-Com: parator Group AN/URA-6 or AN/URA-7. See Figure 3-13. Teletypewriter cables may be connected in the same manner to individual Converter units, if desired, for single-channel operation. See paragraph $5 c(3)$ of this section.

Figure 3-14. Frequency Shift Converter-Comparator Group AN/URA-6 and AN/URA-7, Rear View
(5) I-F INPUT CABLES ON BOTH CON-VERTERS.-Remove the plugs P1111 from I-F INPUT jacks J1111 and disassemble. Using 70 -ohm coaxial cable RG-11/U or RG-12/U, solder the center conductor to the plug center, and the shield to the plug shell (see Figure 3-11). Reassemble plugs and place in proper jacks. The two cables of the two converters will go to separate receivers.
(6) TONE OUTPU'T CABLE. - Remove the plug from TONE OUTPUT jack J1303 and disassemble. If two-wire or single-wire shielded cable is used, solder leads to $A$ and $C$. Pin $B$ is the center tap of the output transformer and should be used only when a balanced grounded output is required. Reassemble plug and replace on TONE OUTPUT jack J1303. Connect a short length of bus wire from pin B of TONE OUTPUT jack J1303 to GND. 4 (see Figure 7-27) if a ground is necessary. Tone output cables may be connected in the same manner to individual Converter units if desired, for single-channel operation. See paragraph $5 c(5)$ of this section.
(7) EXTERNAL TONE INPUT CABLE (IF USED).-Remove plug P1302 from EXT. TONE IN jack J1302. If two-wire or single-wire shielded cable is used, solder leads to $A$ and $B$. Terminals $A$ and $C$ of jack J1302 are connected together. Terminal $B$ of $J 1302$ is connected to the shield and ground. Reassemble plug and insert in jack J1302. Use of this cable is optional. External tone input cables may be connected in the same manner to individual Converter units, if desired, for single-channel operation. See paragraph $5 c(6)$ of this section.
(8) VERTICAL CRT REMOTE CABLE (IF USED).-Optional use may be made of a connection to a remote cathode-ray tube through the VERT. CRT-REMOTE jack J1102 on the Converter units. See paragraph $5 c(7)$ of this section.

## 7. INITIAL ADJUSTMENTS.

Refer to Figure 4-1 for location of front panel controls.
a. FREQUENCY SHIFT CONVERTER CV-57/URR.

RESTRICTED NAVSHIPS 91355

Figure 3-15. Jumper Cable in Use in Frequency Shift Converter CV-57/URR
(1) Measure the power-line voltage by connecting a 150 -volt range a-c voltmeter across the two contacts of the a-c outlet J 1107 located next to PWR INPUT jack J1108 (see Figure 3-10). Pull chassis out of cabinet and remove Power Supply subassembly from chassis. Adjust tap on power transformer T801, if necessary, by changing the grey lead on terminals 2,3 or 4 . Transformer terminals 2 , 3, and 4 are, respectively, for approximate line voltages of 105,115 , and 125 volts. Leave the fan lead (brown) on terminal 3 of the transformer. See Figures 7-4 and 7-29. Re-install Power Supply sub-assembly on chassis and push chassis back in place.
(2) Turn POWER switch, S1401, to ON. Neon pilot light on front panel should light about ten seconds later, which allows for tube warm-up.
(3) Set TUNE-OPERATE switch, S302, to TUNE.
(4) Set the TONE FREQ switch, S602, under the cover on the front panel, to the desired frequency. If an external tone frequency is used, set TONE FREQ to EXT and adjust frequency of tone generator. Adjust to suitable output level with TONE LEVEL control, R629.
(5) After about one minute, adjust the Tuning Monitor as follows:
(a) Using a screwdriver, adjust the INTENSITY control, R713, to give a reasonably bright trace. Too bright a trace will result in short tube life and focusing difficulties.
(b) Using a screwdriver, adjust the FOCUS control, R715, for sharpest trace.
(c) Turn POWER switch to OFF. Slide chassis out of case and connect Cable Filter jack, J1101, and Converter plug, P1401, with jumper cable furnished. See Figure 3-15.
(d) Turn POWER switch to ON and allow about one minute for warm-up. Push CAL IN button, S701, (no signal input, VERT GAIN control, R701, set fully counterclockwise).
(e) Loosen lock nut and adjust R705 (located on the rear of the cathode-ray tube mounting bracket, below the V CENT potentiometer, R702) until scope line coincides with engraved center line. Tighten lock nut. See Figure 7-7.
( $f$ ) Release CAL IN button.

Figure 3-16. Radio Receiver Tuning Pafterns as Seen on Tuning Monitor
(g) Adjust V CENT on panel with a screwdriver until scope line coincides with engraved center line.
(b) Readjust FOCUS with a screwdriver for best average focus with CAL IN button depressed and released.
(i) Make certain S604 (toggle switch on rear bracket of Keyer Unit) is in ON position, see Figure 7-9.
(6) Set SPEED switch to LOW for normal( 60 words per minute) speed or HIGH for highspeed multiplex or speeds greater than 60 words per minute.
(7) Plug a 0-100 ma milliammeter, such as Navy Model OE (connected to a phone plug with the tip to the "minus" and the shank to the "plus" terminal of the meter), into the TTYP jack on the front panel. With no keying signal (steady mark) adjust the loop current control, at the teletype power supply, for 60 ma . When the unit is keying, the current indication on the meter will drop.
(8) Using a signal generator, such as Navy Model LP or equivalent, feed into the associated radio receiver a signal having a frequency within the receiver tuning range. Carefully tune the receiver to this signal, using such tuning meter or indicator as it may have.
(9) Connect an r-f voltmeter ( 40 kc , approximately 10 -volt range), such as Navy Model OBQ or Multimeter ME-25/U series or equivalent, across the DIV. CONT jack J1109 at rear of Converter.
(10) Set the TUNING control, C105, to the approximate center of its range. On the Input Unit (see Figures 7-11, 7-12), adjust the core of transformer T101, and then the top and bottom cores of transformers T102, T103, for maximum indication on the r-f voltmeter. Reduce receiver gain to avoid overloading and keep voltmeter reading on scale. Turning off the receiver bfo may facilitate this adjustment.
(11) Disconnect the Model LP signal generator and tune the radio receiver to a frequency shift signal. With the VERT GAIN control, adjust the separation of the two lines on the cathode-ray tube to a convenient distance apart.
(12) Adjust receiver tuning (main dial on receiver and TUNING dial, C105, on Converter) to center the lines on the cathode-ray tube (see Figure 3-16).
(13) Set TUNE-OPERATE switch, S302, to OPERATE; teletypewriter may start printing.
(14) Push CAL IN button and adjust THRESHOLD control, R318, to produce a pattern on the cathode-ray tube which matches the top and bottom lines engraved on cathode-ray tube window (see Figure 3-17).

Figure 3-17. Tuning Pattern (CAL IN) on Tuning Monitor

Figure 3-18. Adjustment of MOD BAL Control
(15) Release CAL IN button.
(16) Teletypewriter should be printing; if it does not, change position of NORM-REV switch, S603.
(17) Turn the LOW-HIGH-ADJ switch, S601, to the ADJ position and push the CAL IN button. The cathode-ray tube pattern should fit between the top and bottom engraved lines of the window, within about $1 / 16$ inch. This is a sensitivity check of the tuning monitor tube V702 and amplifier tube V601B. If the pattern does not match the engraved lines, the circuits of V601 and the tube V702 itself need checking as described in Section 6.
(18) Turn the LOW-HIGH-ADJ switch to original (LOW or HIGH) position.
(19) Connect an external test oscilloscope, such as Oscilloscope OS-8/U, Navy Model OBL or OBT series, to the TONE OUTPUT or PHONE jacks, J1105 or J1402, and with TONE FREQ switch, S602, on EXT', TONE LEVEL control, R629, on 10 , no tone input adjust MOD BAL control, R633, for minimum transients, as seen on the oscilloscope (see Figure 3-18).
(20) Adjust the \%MARK control, R613, as follows:
(a) Set SPEED switch. S601, on the ADJ position.
(b) Connect external oscilloscope input across a 20 -ohm resistor connected to a plug inserted in the TTYP jack.
(c) Set test oscilloscope sweep for approximately 90 cycles with sync off.
(d) Adjust sweep control on scope for the peak of one cycle to be centered in the trough of another cycle.
(e) Adjust the \%MARK control until the peaks and troughs are equal in width (see Figure 3-19).
( $f$ ) Remove test oscilloscope and return SPEED switch to former (LOW or HIGH) position. Teletypewriter should be printing normally. If it is not, repeat procedure. If operation is still unsatisfactory, equipment needs trouble-shooting, see Section 7.
( $g$ ) If no teletypewriter equipment is available for connection to the Frequency Shift Converter CV-57/URR, use the following ALTERNATE PROCEDURE in place of the above steps (a) to ( $f$ ).

1. Set SPEED switch to ADJ position.
2. Connect an audio voltmeter to the PHONES jack, J1402, on the front panel.
3. Set the TONE FREQ switch, S602, to the 1785 -cycle position and the TONE LEVEL control, R629, to its maximum position.
4. Place the NORM-REV switch S603 alternately in the FORM and REV positions and adjust the \%MARK control, R613, to obtain equal indications on the audio voltmeter in the two positions of the switch.
(21) Cut off power. Remove jumper cable and push chassis back in case. Remove voltmeter from DIV. CONT jack.
b. FREQUENCY SHIFT CONVERTER CV-71/-URR.-Initial adjustments for Frequency Shift Converter CV-71/URR are the same as for Frequency Shift Converter CV-57/URR as set forth in the preceding paragraph $7 a$ except in sub-paragraph $7 a(10)$ read $T 201, \mathrm{~T} 202, \mathrm{~T} 203$ instead of T101, T102, T103. Note that the signal from the associated receiver is of the order of 50 kc instead of 400 kc .
c. FREQUENCY SHIFT CONVERTER-COMPARATOR GROUP AN/URA-6 or AN/URA-7.
(1) Set up each channel as described in paragraph $7 a$ or $7 b$ of this section with:
(a) The teletypewriter plugged into the channel being adjusted.
(b) Note that instead of connecting an r-f voltmeter as in step (9) of paragraph 7a, the meter on the front panel of Comparator CM-14/URR may be used as an indicating device when aligning the Input Unit transformers.
(2) Measure the power-line voltage by connecting a 150 -volt range a-c voltmeter, such as Navy type 60044 Vacuum-tube volt-ohm-meter or equivalent, across contacts of the a-c outlet on one of the two Converter units (see paragraph $7 a(1)$ of this section). Pull chassis out of cabinet and remove Power Supply sub-assembly from chassis. Adjust tap on power transformer T1001 of the Comparator, if necessary, by changing the grey lead on terminal

Figure 3-19. Test Oscilloscope Patferns for \% MARK Control Adjustment

2, 3, or 4. Transformer terminals 2, 3, and 4 are, respectively, for approximate line voltages of 105 , 115 , and 125 volts. Do not change the fan lead (brown) from terminal 3. See Figures 7-6 and 7-31. Re-install Power Supply sub-assembly on chassis and push chassis back into cabinet.
(3) Turn Comparator POWER switch to ON. Neon pilot light on front panel should light after about ten seconds.
(4) Set the TONE FREQ switch, S602, under the front panel cover of the Comparator (see Figure 4-1) to the desired frequency. If an external tone frequency in place of internal tone is used set TONE FREQ to EXT' and adjust the frequency of the tone generator. Adjust signal to suitable output level with TONE LEVEL control.
(5) Set SPEED switch, S601, on Comparator to LOW for normal-( 60 words per minute) or HIGH for high-speed multiplex or speeds greater than 60 words per minute.
(6) Plug a $0-100$ ma milliammeter, such as Navy Model OE (connected to a phone plug with the tip to the "minus" and the shank to the "plus" terminal of the meter), into the TTYP jack on the front panel. With no keying signal (steady mark) adjust the loop current control, at the teletype power supply, for 60 ma . When the unit is keying, the current indication on the meter will drop.
(7) With channel A (top Converter unit) receiving signals, set CHANNEL A-COMBINEDCHANNEL B switch to CHANNEL A position.
(8) Connect the external test oscilloscope to the TONE OUTPUT or PHONE jack, J1303 or J1602, of Comparator and with TONE FREQ on EXT, TONE LEVEL control, R629, on 10 , no tone input adjust MOD BAL control, R633, for a minimum of transients.

Figure 3-20. Test Oscilloscope Pafterns for GATE BAL Control Adjustment
(9) Adjust \%MARK control, R613, of Comparator as follows:
(a) Set SPEED switch to ADJ.
(b) Connect external oscilloscope input across a 20 -ohm resistor connected to a plug inserted in the TTYP jack.
(c) Set test oscilloscope horizontal sweep for approximately 90 cycles with sync off.
(d) Adjust test oscilloscope sweep control for the peak of one cycle to be centered in the trough of another cycle.
(e) Adjust the \%MARK control until the peaks and troughs are equal widths (see Figure 3-19).
(f) Remove oscilloscope and return SPEED switch to original position. Teletypewriter should print normally. If it does not, change position of Comparator NORM-REV switch.
(g) If no teletypewriter equipment is available for connection to the Frequency Shift ConverterComparator Group, use the following ALTERNATE PROCEDURE in place of the above steps $(a)$ to $(f)$ :

1. Set SPEED switch to ADJ position.
2. Connect an audio voltmeter to the PHONES jack on the front panel.
3. Set the TONE FREQ switch to the 1785-cycle position and the TONE LEVEL control to its maximum position.
4. Place the NORM-REV switch alternately in the NORM and REV positions and adjust the \%MARK control to obtain equal indications on the audio voltmeter in the two positions of the switch.
(10) Adjust GATE BAL control, R923 (see Figure 4-1), as follows:
(a) Slide the Comparator out of the cabinet and connect to Cable Filter Unit by jumper cable supplied.

RESTRICTED
NAVSHIPS 91355

## AN/URA-6, AN/URA-7 <br> CV-57/URR <br> INSTALLATION

(b) Connect a jumper from a filament lead to grid of V903, pin 6 (location of this tube is shown in Figures 5-4 and 7-45).
(c) Set CHANNEL A-COMBINEDCHANNEL B switch to COMBINED.
(d) Connect a test oscilloscope to V906 cathode, pin 3, and ground.
(e) Channel switching is now occurring at a 60 -cycle rate. The test oscilloscope pattern will be a square wave switching oscillogram. Adjust the GATE BAL for minimum of pattern (see Figure 3-20).
( $f$ ) Turn power off and remove jumper and test oscilloscope.
(g) Throw switch S604 (on the rear bracket of the Keyer Unit) to the ON position.
(11) Adjust CONT BAL control, R905 (see Figure 4-1), as follows:
(a) Set CHANNEL A-COMBINEDCHANNEL B switch, S901, to COMBINED.
(b) Set CHANNEL A LEVEL-DIV INDCHANNEL B LEVEL switch, S1602, to DIV IND.
(c) Set links O901 and O902 (on Diversity Selector Unit) to I-F position. See Figure 7-18.
(d) Apply separate 1000 -cycle signals of about 0.1 volt to DIV-CONT CHAN-A jack J1308 and DIV-CONT CHAN-B jack J1309 on the rear of the Cable Filter. One channel will conduct. If the panel meter, M1601, reads approximately 50 , channel $A$ is conducting; if meter reads approximately 150 , channel $B$ is conducting; and if meter reads approximately 100 , the channels are switching too fast for the meter to follow. The latter case will not occur during this adjustment. The output signals of the two associated receivers may be used for this purpose if an electron-tube a-c voltmeter is used to measure the diversity control voltages which appear at DIVCONT CHAN-A jack J1308 and DIV-CONT CHAN-B jack J1309. To connect the voltmeter to these jacks, first remove the Cable Filter Unit top cover, and this will give access to the desired terminals at the rear of the jacks.
(e) Increase the input voltage to the channel not conducting until it conducts, as indicated by the meter. Record the increase in voltage necessary to make it conduct, then reduce the voltage to 0.1 volt.
( $f$ ) Increase input voltage on other channel until it conducts, as shown by panel meter and record voltage. If the two voltages recorded in steps ( $e$ ) and ( $f$ ) are within 10 per cent of each other, then the CONT BAL is correctly adjusted. If they are
not, change the CON'T BAL setting and repeat procedure until voltages to shift each channel are equal.
$(g)$ If the preceding procedure is impracticable because of lack of necessary test equipment or for any other reason, use the following ALTERNATE SIMPLIFIED PROCEDURE for adjusting the CONT BAL control:

When the CON' BAL control, R905, is properly adjusted, the operation of the CHANNEL A-COMBINED-CHANNEL B switch, S901, should be as follows. With no signal from either channel and with the switch in the CHANNEL $A$ position, the panel meter, M1601, should indicate approximately 50; and throwing the switch over to the COMBINED position should not change this indication. With the switch in the CHANNEL $B$ position, the panel meter should indicate approximately 150 ; and throwing the switch into the COMBINED position should not change this indication. If the meter indication should change when turning the switch from the CHANNEL A or CHANNEL B position to the COMBINED position, adjust the CONT BAL control until no such change is observed on the meter.
(b) Pull the Comparator chassis out of the case and connect its 14 -conductor jumper cable. Set the TONE FREQ switch to 1785 -cycle position. Insert a lead into the PHONES jack on the front panel and touch the free end of the lead to the diversity control input "A" on the Diversity Selector Unit (this point is marked " $A$ " in Figure $7-18$ and is shown in Figure 7-45 as terminal 8 of E905). Adjust the TONE LEVEL control, R629, to obtain an indication of 50 on the panel meter, M1601. Next move the free end of the lead to the diversity control input "B" on the Diversity Selector Unit (this point is marked "B" in Figure 7-18 and is shown in Figure $7-45$ as terminal 22 of E901). The panel meter should indicate $50 \pm 20 \%$. If it does not, the circuits of the Diversity Selector Unit require checking and trouble shooting for faulty tubes or circuit components. Use the information (schematic diagrams, wiring diagrams. voltage and resistance measurements) given in Section 7.
(i) Remove signal from DIV-CONT CHANA and DIV-CONT CHAN-B jacks J1308 and J1309, and plug original cables in place. This completes the adjustment of the AN/URA-6 or AN/URA-7.

## CAUTION

Any of the Keyers not connected to teletypewriters in operating condition must have switch $\mathbf{S 6 0 4}$ (on rear bracket of Keyer Unit) in the OFF position.

## SECTION 4 OPERATION

## 1. INTRODUCTION.

The Frequency Shift Converters covered by this instruction book are only part of a complete teletypewriter radio receiving system. Other equipment necessary for use of Frequency Shift Converter CV-57/URR includes an antenna to pick up the radio signals, a radio receiver to select and amplify the radio signals, and a teletypewriter with a d-c power supply to provide loop current. If the tone signal is used for transmission to a remote point, terminal equipment to operate from the on-off keyed tone must also be provided. A frequency shift keyed signal centered about the intermediate frequency of the associated radio receiver is the input signal for the Frequency Shift Converter. This signal shifts to higher and lower frequencies corresponding to the characters transmitted. The Frequency Shift Converter translates the frequency shifts into off-on keyed d-c square-wave pulses to key the receiving teletypewriter loop circuit.

Since the teletypewriter signals are essentially d-c signals (square waves), transmission over telephone lines is limited; therefore, a tone modulator, keyed on and off by the teletype signals, is provided. This onoff keyed tone signal must be demodulated to operate a teletypewriter.

The Frequency Shift Converter-Comparator Group, AN/URA-6 or AN/URA-7, serves the same purpose, respectively, as Frequency Shift Converter CV-57/URR or CV-71/URR, except that two receivers are used for diversity operation. The Comparator CM14/URR compares continuously the levels of the two signals, and select the stronger one to key the teletypewriter loop circuits. When diversity operation is not required, the two converters can be used for
different signals and operate different teletypewriters.

## 2. CAPABILITIES AND LIMITATIONS.

The equipment provides the best possible teletype signals when not subjected to interference and the irregularities of radio transmission. It will give accurate conversion up to the point when the noise level is approximately equal to or greater than the signal. The Radio Receiver output signal level must be high enough to keep the input to the limiter stage well above saturation level.

Little attention of the operator is required during operation after the equipment has warmed up (warm-up time for the Converters and Comparator is about ten minutes; additional time may be required for the associated receivers). The tuning monitor gives continuous, visible monitoring of the discriminator output. The neon ON indicator, operating from the +200 volt supply, gives a continuous indication of the B-power supply for the tubes.

The meter in the Comparator can be switched to indicate the signal strength of each channel or to indicate which channel is selected at the moment to control the keyer.

## 3. OPERATING CONTROLS.

All operating controls are located on the front panel with all but the essential operating controls located under a center cover or behind oil-cup-type hole covers. This feature helps prevent breaks in service due to the operator manipulating the wrong knob accidentally. All but two controls, primarily of a maintenance nature, are accessible from the front panel.

## RESTRICTED NAVSHIPS 91355

Figure 4-1. Operating Panel Controls

## 4. TUNING ADJUSTMENT.

Tuning is accomplished with the associated radio receiver, but the following adjustments are necessary on the CV-57/URR, AN/URA-6 and AN/-URA-7 equipments ( see Figure 4-1):

CONTROL TUNING

AFC ON-OFF

TUNE-OPERATE

THRESHOLD

NARROW-WIDE

TONE FREQ

TONE LEVEL Adjusts the amplitude of the tone signal.
SPEED

NORM-REV
4-2 or high-spced teletypewriter. Applies a standard voltage for adjustments in the ADJ position.
Reverses polarity of teletype signals.

CONTROL POWER, OFF-ON

VERT GAIN

CAL IN

## FUNCTION

Turns power to equipment on or off. Does not de-energize fuses, convenience outlet, power line filter or switch wiring.

Adjusts height of pattern on cathoderay tube.

When depressed, connects cathoderay tube to indicate Keyer input voltage.

The following controls are on the Comparator CM-14/URR, part of the AN/URA-6 or AN/-URA-7 equipments.

## CONTROL

CHANNEL A-COMBINED-

CHANNEL B

CHANNEL A
LEVEL-DIV
IND-
CHANNEL
B LEVEL

## FUNCTION

Switches Comparator Keyer to channel A alone, both channels in diversity operation, or channel $B$ alone.

Shows signal level of channel $A$, which channel is supplying the signal in diversity operation, or the signal level of channel $B$.

## 5. SUMMARY OF OPERATION.

a. SINGLE-CHANNEL CV-57/URR STARTING PROCEDURE.
(1) Turn POWER switch of Frequency Shift Converter to $O N$, turn on power to radio receiver and teletypewriter and allow sufficient time for all equipment to warm up.
(2) Set TUNE-OPERATE switch of the Frequency Shift Converter to TUNE and AFC ON-OFF control to ON.
(3) Tune in a frequency shift signal on the radio receiver with receiver bfo adjusted to give a beat note of about 1000 cycles, using a pair of headphones to assist in locating the signal. Receiver bfo may now be turned off if desired. The receiver tuning controls serve for rough tuning adjustment while the TUNING control on the Converter front panel serves for fine (vernier) tuning. Adjust the tuning controls carefully to vertically center the horizontal lines on the Tuning Monitor. See Figure 3-16.
(4) Set TUNE-OPERATE switch to OPERATE.
(5) Push CAL IN button and adjust the THRESHOLD control, to produce cathode-ray tube pattern which matches lines engraved on tuning monitor window. See Figure 3-17.
(6) Release CAL IN button.
(7) Teletypewriter should be printing correctly; if it is not, change the position of the NORMREV switch. If trouble is not corrected, advise technician.
(8) Observe the Tuning Monitor indication occasionally and readjust receiver tuning as necessary to maintain proper operation until the equipment has thoroughly stabilized.
b. TUNING SINGLE-CHANNEL, CV-57/URR, TO ANOTHER FREQUENCY.
(1) Set TUNE-OPERATE switch to TUNE and AFC control to ON.
(2) Tune in a frequency shift signal on the radio receiver with receiver bfo adjusted to give a beat note of about 1000 cycles, using a pair of headphones to assist in locating the signal. Receiver bfo may now be turned off if desired. The receiver tuning controls serve for rough tuning adjustment while the TUNING control on the Converter front panel serves for fine (vernier) tuning. Adjust the tuning controls carefully to vertically center the horizontal lines on the Tuning Monitor. See Figure 3-16.
(3) Set TUNE-OPERATE switch to OPERATE.
(4) Push CAL IN button and adjust THRESHOLD control, to produce cathode ray tube pattern which matches lines engraved on the Tuning Monitor window. See Figure 3-17.
(5) Release CAL IN button.
(6) Teletypewriter should now be printing; if it is not, change the position of the NORM-REV switch.
c. OTHER ADJUSTMENTS, SINGLE CHANNEL.
(1) TONE LEVEL.-Adjustment can be made any time by means of the TONE LEVEL control R629. If an external tone source is used, adjustment can also be made, independently, by changing the amplitude at the source. Tone will not be keyed on and off when TUNE-OPERATE switch is in TUNE position when there is no signal being received and when a steady mark signal is being received.
(2) TONE FREQUENCY.-Adjustment can be made at any time convenient to the operator when using the internal tone oscillator. An external signal (switch on EXT) can only have its frequency adjusted at the source.
(3) MAINTENANCE ADJUSTMENTS. - Adjustments other than those mentioned are part of the initial and maintenance adjustments. For further information see sections 3 and 7 of this book.
d. STOPPING THE SINGLE-CHANNEL EQUIP-MENT.-To stop the equipment throw the Frequency Shift Converter POWER switch to ÓFF.

## e. DUAL-CHANNEL AN/URA-6 or AN/URA-7

 STARTING PROCEDURE.(1) Throw the POWER switches of each of the three units to ON. Turn on power to the two radio receivers and teletypewriter and allow sufficient time for all equipment to warm up.
(2) Set the TUNE-OPERATE switches of the two Frequency Shift Converters to TUNE and the AFC controls to ON.
(3) Tune in a frequency shift signal on both radio receivers with receiver bfo adjusted to give a beat note of about 1000 cycles, using a pair of headphones to assist in locating the signal and to make sure that both receivers are tuned to the same signal. Receiver bfo may now be turned off if desired. The receiver tuning controls serve for rough tuning adjustment while the TUNING control on the Converter front panel serves for fine (vernier) tuning. Adjust the tuning controls carefully to vertically center the horizontal lines on the Tuning Monitor. See Figure 3-16.
(4) Adjust the frequency of each receiver accurately to be sure they are tuned to the same signal.
(5) Set TUNE-OPERATE switch on each of the Converters to OPERATE.
(6) Push CAL IN button and adjust each THRESHOLD control to produce cathode-ray tube pattern which matches lines engraved on tuning monitor window. See Figure 3-17.
(7) Release CAL IN button.
(8) Set CHANNEL A-COMBINED-CHANNEL B switch of the Comparator to CHANNEL A. The teletypewriter should operate. If the printing appears to be garbled, change the position of the NORM-REV switch of the Comparator.
(9) Set CHANNEL A-COMBINED-CHANNEL B switch of the Comparator to CHANNEL B. The teletypewriter should operate. If the printing appears to be garbled, check the tuning of the channel $B$ receiver to make sure it is tuned to the same signal as the channel $A$ receiver.
(10) Set channel $B$ receiver gain to zero. Set CHANNEL A LEVEL-DIV IND-CHANNEL B LEVEL switch to CHANNEL $A$ and adjust channel A radio receiver output (gain control) for a reading of approximately 90 microamperes on the Comparator meter. Adjust channel $B$ receiver gain until meter reads half of above setting.
(11) Set CHANNEL A LEVEL-DIV INDCHANNEL B LEVEL switch to CHANNEL B LEVEL position. The meter should now read approximately the same as for channel $A$.
(12) Set CHANNEL A-DIV IND-CHANNEL B switch to DIV IND. A reading of approximately 50 microamperes indicates channel $A$ is supplying the signal, 150 microamperes indicates channel $B$ is supplying the signal and 100 microamperes indicates the channels are switching too rapidly for the meter to follow. If one channel carries the signal most of the time increase the receiver gain of the other channel.
f. TUNING DUAL-CHANNEL, AN/URA-6 or AN/URA-7, to ANOTHER FREQUENCY.
(1) Set the TUNE-OPERATE switches of the Converters to TUNE and AFC controls to ON.
(2) Tune in a frequency shift signal on both radio receivers with receiver bfo adjusted to give a beat note of about 1000 cycles, using a pair of headphones to assist in locating the signal and to make sure that both receivers are tuned to the same signal. The receiver bfo may now be turned off if desired. The receiver tuning controls serve for rough tuning adjustment while the TUNING control on the Converter front panel serves for fine (vernier) tuning. Adjust the TUNING control carefully to vertically center the horizontal lines on the Tuning Monitors.

See Figure 3-16.
(3) Set TUNE-OPERATE switch on each of the Converters to OPERATE.
(4) Push CAL IN button and adjust each THRESHOLD control to produce cathode-ray tube pattern which matches lines engraved on tuning monitor window. See Figure 3-17.
(5) Release CAL IN button.
(6) Set CHANNEL A-COMBINED-CHANNEL B switch of the Comparator to CHANNEL A. The teletypewriter should operate. If the printing appears to be garbled, change the position of the NORM-REV switch of the Comparator.
(7) Set CHANNEL A-COMBINED-CHANNEL B switch of the Comparator to CHANNEL B. The teletypewriter should operate. If the printing appears to be garbled, check the tuning of the channel $B$ radio receiver to make sure both radio receivers are tuned to the same signal.
(8) Set Channel B receiver gain to zero. Set CHANNEL A LEVEL-DIV IND-CHANNEL B LEVEL switch to CHANNEL $A$ and adjust channel A radio receiver gain for a reading of approximately 90 microamperes on the Comparator meter. Adjust channel $B$ receiver gain until meter reads half of above setting.
(9) Set CHANNEL A LEVEL-DIV INDCHANNEL B LEVEL switch to CHANNEL B LEVEL. The meter should now read approximately the same as for channel $A$.
(10) Set CHANNEL A-DIV IND-CHANNEL $B$ switch to DIV IND. A reading of approximately 50 microamperes indicates channel $A$ is supplying the signal, 150 microamperes indicates channel $B$ is supplying the signal and 100 microamperes indicates the channels are switching too rapidly for the meter to follow. If one channel carries the signal most of the time increase the receiver gain of the other channel.
g. OTHER ADJUSTMENTS, DUAL CHANNEL.
(1) TONE LEVEL.-Adjustment can be made any time by means of the TONE LEVEL control R629. If an external source is used, adjustment can also be made, independently, by changing the amplitude at the source.
(2) TONE FREQUENCY.-Adjustment can be made at any time, operating or non-operating.
(3) SINGLE CHANNEL OPERATION.Should it be desired to operate the teletypewriter from one particular channel only, set the CHANNEL A-COMBINED-CHANNEL B switch to CHANNEL $\Lambda$ or CHANNEL $B$, depending on which channel is to operate the teletypewriter. Each Frequency Shift

Converter CV-57/URR or CV-71/URR can be used independently by connecting separate teletypewriter loops to TTYP OUTPUT jack J1106 of the respective Converters.

## CAUTION

Any of the Keyer Units not connected to teletypewriters in operation must have toggle switch S604 (on rear bracket of Keyer Unit) in the OFF position.
(4) MAINTENANCE ADJUSTMENTS.-Adjustments other than those mentioned are part of the maintenance or initial adjustments. For further information, see Sections 3 and 7 of this book.
h. STOPPING THE DUAL-CHANNEL EQUIP-MENT.-To stop the equipment throw the POWER switches on each of the three units to OFF.

## SECTION 5 OPERATOR'S MAINTENANCE

## 1. ROUTINE CHECKS.

Make the following Tuning Monitor sensitivity check once a week when possible:
a. Set the SPEED switch of the Frequency Shift Converters to the ADJ position.
b. Observe the lines on the tuning monitor screen. They should coincide, within $1 / 16$ inch, with the top and bottom lines inscribed on the Tuning Monitor window. If they do not, report to technician.

## 2. EMERGENCY MAINTENANCE.

## NOTICE TO OPERATORS

Operators shall not perform any of the following emergency maintenance procedures without proper authorization.
a. REPLACING FUSES.

## WARNING

Never replace a fuse with one of a higher rating unless continued operation of the equipment is more important than probable damage. If a fuse burns out immediately after replacement, do not replace it a second time until the cause has been corrected.

Figure 5-1. Frequency Shift Converters CV-57/URR and CV-71/URR Fuse Locations

RESTRICTED
NAVSHIPS 91355

Figure 5-2. Frequency Shiff Converter-Comparator Groups AN/URA-6 and AN/URA-7 Fuse Locations
( i) SYMPTOMS OF FUSE FAILURE.-Pilot light not lighted. Tubes will be cold when chassis is pulled from case.
(2) FUSE LOCATIONS.-The fuses are located one above the other at the left rear of the cabinet in the Cable Filter Compartment. Spare fuses will be found to the right of the fan. See Figures 5-1 and 5-2.
(3) REPLACEMENT.
(a) Slide chassis out of cabinet and tilt 4 degrees.
(b) Reach in cabinet and unscrew one fuse holder cap by turning cap counterclockwise. Cap with fuse is now free of holder.
(c) Pull fuse from cap and replace with new one, if blown.
(d) If fuse is good screw cap, in a clockwise direction, back in holder and repeat with the other fuse.
(e) Slide chassis back in cabinet.

## b. REPLACING ELECTRON TUBES.

## WARNING

This equipment employs voltages which are dangerous and may be fatal if contacted. Always observe all safety regulations and precautions. Refer to the Safety Notices and high-voltage Warning printed on pages viii and ix in the Front Matter of this instruction book.
(1) LOCATING DEFECTIVE TUBE.-Defective tubes may be located as follows. Turn the POWER switch to OFF. Slide the chassis out of the case and connect the jumper cable (W1402 for the Converter or W1602 for the Comparator) between the cable filter jack (J1201 or J1301 as the case may be) and the corresponding plug. Turn the POWER switch to ON and allow about one minute warm-up time. Tubes which fail to glow and also feel cold when touched are defective. KEEP AWAY FROM LIVE CIRCUITS.
(2) REPLACING ELECTRON TUBES.
(a) SPECIAL PRECAUTIONS.

1. Turn off power before changing tubes.
2. When replacing the $1 Z 2$ tube, V801 or

Figure 5-3. Frequency Shift Converters CV-57/URR and CV-71/URR Tube Locations

Figure 5-4. Comparator CM-14/URR Tube Locations

Figure 5-5. Removal of Cathode-ray Tube from Tuning Monitor

V1001, AVOID CONTACT WITH THE INSIDE CLIP OF THE CAP or a shock may be experienced if the bleeder resistors are open. The cap is insulated and normal handling of the cap will prevent contact, but the inside contact of the cap may be discharged as follows: hold the shank of a screwdriver firmly in contact with the chassis, then touch the inside metal clip of the cap to the tip of the screwdriver.
3. The cathode-ray tube, V702, MUST BE HANDLED CAREFULLY. Always keep these tubes in their shipping cartons when not in use. Scratches on the bulb may impair their usability and increase the chance of breakage. Do not knock the tubes. IT IS RECOMMENDED THAT PROTECTIVE GOGGLES, GLOVES, AND CLOTHING BE WORN WHILE HANDLING A CATHODE-RAY TUBE.
(b) TUBE CLAMPS.-Three types of tube clamps are used, the push-and-turn shield, the springwire type and the screw-clamp type (used only on the cathode-ray tube). Remove and replace clamps as follows:

1. PUSH-AND-TURN SHIELD.-Push shield downward, turn counterclockwise as far as it will go, and lift off. Replace tube, slide shield down over locking pins as far as it will go, turn clockwise, and release.
2. SPRING-WIRE CLAMP.-Push spring wire to side and pull out tube, insert new tube and release spring wire.
3. SCREW CLAMP. - WARNING: JUMPER CABLE SHOULD NOT BE CONNECTED. See Figure 5-5. Unscrew rear thumbscrew of cathode-ray tube socket, remove front window on panel, and through hole in socket, push tube forward through hole in front panel, using a rod (see Figure 5-5) such as a pencil or similar tool. Replace tube, tighten thumbscrew and replace panel window. Front thumbscrew may have to be loosened to rotate tube so image lines on tube are parallel to engraved lines on window.
c. REPLACING SUB-CHASSIS.-The sub-chassis units may be replaced in little more time than necessary to change a tube. Three (or four) screws hold the units in place and all connections are made automatically by plugs and jacks. When removing a sub. chassis from the main chassis, loosen rear screws first and front screws last. When installing a sub-chassis tighten the front screws first and the rear screws last

If the equipment fails to operate correctly afte the above measures have been taken, advise a tech nician.

## TABLE 5-1 ROUTINE CHECK CHART

The following chart shows routine check, with no signal input, to be made by operator every week. If test shows failure, report to technician.

| WHAT TO CHECK | NORMAL INDICATION | PROCEDURE |
| :---: | :---: | :---: |
| Tuning Monitor Sensitivity Tone Oscillator <br> NORM-REV Switch <br> CONT BAL control | See paragraph 1 <br> Tone heard when plugging headphones in PHONES jack <br> Same as above <br> No change in Comparator Meter reading when CHANNEL A-COMBINEDCHANNEL $B$ switch is operated from COMBINED position to CHANNEL A or to CHANNEL B position | Report to technician <br> Plug headphones in PHONES jack, listen for tone at all positions of TONE FREQ control <br> Same as above but repeat for both positions of NORM-REV switch <br> See Section 6, paragraph $2 f$ |

## SECTION 6

## PREVENTIVE MAINTENANCE

1. ROUTINE MAINTENANCE.

## NOTE

THE ATTENTION OF MAINTENANCE PERSONNEL IS INVITED TO THE REQUIREMENTS OF CHAPTER 67 OF THE bUREAU OF SHIPS MANUAL, OF THE LATEST ISSUE.

Every 1000 hours check or adjust the following items:
a. JUMPER CABLES.-Check each jumper cable by sliding the chassis out of the case and operating the equipment with the cable in place.
$b$. TUBES.-Check all tubes except the cathoderay tube in a tube tester and replace any showing signs of deterioration. The condition of the cathoderay tube is best shown by the unit control settings. Controls associated with tubes being replaced should be readjusted as described in Sections 3 and 7.
c. SYSTEM SENSITIVITY.- Check the system sensitivity as follows:
(1) Connect an r-f signal generator, such as R-F Signal Generator Set AN/URM-25 series or equivalent (approximately 400 kc for $C V-57 / U R R$ or AN/URA-6 equipments or 50 kc for AN/URA-7 equipment) to the I-F INPUT jack J1111. The outpat impedance should be approximately 70 ohms for

CV-57/URR or AN/URA-6 equipments; and approximately 910 ohms for AN/URA-7 equipment.
(2) Connect an external oscilloscope (such as Oscilloscope OS-8/U, Navy Models OBL, OBT or equivalent) to the plate, pin 5, of the limiter tube V302 and ground.
(3) Vary the output voltage of the r-f signal generator over a range of 2500 microvolts to 0.5 volt. The pattern should be a square wave over the entire range, showing limiter action. After completion of test remove r-f signal generator and external oscilloscope.
d. TUNING MONITOR SENSITIVITY.-Set the SPEED switch of the Converter units to the ADJ position and depress the CAL IN button. The image lines on the cathode-ray tube should coincide with the top and bottom lines on the tuning monitor window. If the amplitude is less than it should be, check the circuits of V601B in the Keyer Unit, the voltage source (resistors R639 and R640 in the Kcyer) or replace the cathode-ray tube V702.
$c$. TUNING MONITOR ADJUSTMENT.-Readjust the Tuning Monitor as follows:
(1) Using a screwdriver, adjust the INTENSITY control R713 to give a reasonably bright trace.

Too bright a trace will result in short tube life and focusing difficulties.
(2) Using a screwdriver, adjust FOCUS control for sharpest trace.
(3) Slide chassis out of case and connect Cable Filter jack and Converter plug with jumper cable furnished.
(4) Set TUNE-OPERATE switch to TUNE, SPEED switch on HIGH or LOW.
(5) Push CAL IN button.
(6) Loosen lock nut and adjust R705 until horizontal trace on oscilloscope is centered vertically with center line engraved on tuning monitor window. Tighten lock nut.
(7) Release CAL IN button.
(8) Adjust V CENTER on panel, with a screwdriver, so tuning monitor trace is centered vertically with center line engraved on tuning monitor window.
(9) Remove jumper cable and push chassis back in case.

## f. \%MARK CHECK.

(1) Set the SPEED switch to ADJ position.
(2) Connect an external test oscilloscope, such as Navy OBL or OBT series, across a $\mathbf{2 0}$-ohm resistor connected to a plug inserted in the TTYP jack.
(3) Set the test oscilloscope sweep speed for approximately 90 cycles with sync off.
(4) Adjust the sweep control on the test oscilloscope for the peak of one cycle to be centered in the trough of another cycle (see Figure 6-1).
(5) If the troughs and peaks are unequal in width adjust the $\%$ MARK control to make them equal.
(6) After completion of check return SPEED switch to former position.
(7) If no teletypewriter equipment is available

Figure 6-1. Test Oscilloscope Patterns for \% MARK Control Adjustment
for connection to the Frequency Shift ConverterComparator group, use the following ALTERNATE PROCEDURE in place of the above steps:
(a) Set SPEED switch to ADJ position.
(b) Connect an audio voltmeter to the PHONES jack on the front panel.
(c) Set the TONE FREQ switch to the 1785cycle position and the TONE LEVEL control to its maximum position.
(d) Place the NORM-REV switch alternately in the NORM and REV positions and adjust the /MARK control to obtain equal indications on the audio voltmeter in the two positions of the switch.
g. MOD BAL CHECK.-With the TONE FREQ control on EXT, TONE LEVEL control on 10 and no tone signal input, look for transients as part of the pattern of the test oscilloscope connected to the TONE OUTPUT or to the PHONE jack. Adjust the MOD BAL control for minimum transients. Disconnect the test oscilloscope.

## b. GATE BALANCE ADJUSTMENT.

(1) Slide the Comparator out of the cabinet and connect to Cable Filter by means of the jumper cable supplied.
(2) Connect a jumper from a filament lead to grid of V903, pin 6 (location of this tube is shown in Figures 5-4 and 7-45).
(3) Set CHANNEL A-COMBINED-CHANNEL B switch to COMBINED.
(4) Connect a test oscilloscope from V906 cathode, pin 3, to ground.
(5) Channel switching is now occurring at a 60 -cycle rate.

The oscilloscope pattern will be a square wave switching oscillogram. Adjust the GATE BAL control for minimum of pattern (see Figure 6-2).

Figure 6-2. Test Oscilloscope Patterns for GATI BAL Control Adiustment
(6) Turn off power and remove jumper and scilloscope.
i. TELETYPEWRITER LOOP CURRENT AD-IUSTMENT.-Plug a 0-100 ma milliammeter, such is Navy Model OE series (connected to a phone plug with the tip to the "minus" and the shank to the "plus" terminal of the meter), into the TTYP jack on the front panel. With no Keying signal adjust he loop current control, at the teletype power supply, for 60 ma . When the unit is Keying normally, the current indication on the meter will drop.

## ADJUSTMENT AFTER REPLACEMENT OF

D-C AMPLIFIER V903.
Adjust CONT BAL control (shown in Figure 4-1) follows:
a. Set CHANNEL A-COMBINED-CHANNEL $B$ switch to COMBINED.
b. Set CHANNEL A LEVEL-DIV IND-CHAN NEL B LEVEL switch to DIV IND.
c. Apply separate 1000 -cycle signals of about 0.1 volt to DIV-CONT CHAN-A jack J1308 and DIV-CONT CHAN-B jack J1309 on the rear of the Cable Filter. One channel will conduct. If the panel meter, M1601, reads approximately 50 , channel $A$ is conducting; if meter reads approximately 150 , chanel $B$ is conducting; and if meter reads approxinately 100 , the channels are switching too fast for the meter to follow. The latter case will not occur luring this adjustment. The output signals of the :wo associated receivers may be used for this purpose $f$ an electronic voltmeter, such as in Multimeter $\mathrm{ME}-25 / \mathrm{U}$ series, is used to measure the diversity :ontrol voltages which appear at DIV-CONT CHAN-A jack J1308 and DIV-CONT CHAN-B ack J1309. To connect the voltmeter to these jacks, irst remove the Cable Filter Unit top cover, and this vill give access to the desired terminals at the rear f the jacks.
$d$. Increase the input voltage to the channel not onducting until it conducts, as indicated by the reter. Record the increase in voltage necessary to aake it conduct, then reduce the voltage to 0.1 volt. $e$. Increase input voltage on other channel until it onducts, as shown by panel meter and record voltge. If the two voltages recorded in steps $d$ and $e$ re within 10 per cent of each other, then the CONT $A L$ is correctly adjusted. If they are not, change be CONT BAL setting and repeat procedure until oltages to shift each channel are equal.
$f$. If the preceding procedure is impracticable because of lack of necessary test equipment or for any other reason, use the following ALTERNATE SIMPLIFIED PROCEDURE for adjusting the CONT BAL control:

When the CONT BAL control, R905, is properly adjusted, the operation of the CHANNEL A-COM-BINED-CHANNEL B switch, S901, should be as follows. With the switch in the CHANNEL A position, the panel meter, M1601, should indicate approximately 50 ; and throwing the switch over to the COMBINED position should not change this indication. With the switch in the CHANNEL B position, the panel meter should indicate approximately 150 ; and throwing the switch into the COMBINED position should not change this indication. If the meter indication should change when turning the switch from the CHANNEL A or CHANNEL B position to the COMBINED position, adjust the CONT BAL control until no such change is observed on the meter.
g. Pull the Comparator chassis out of the case and connect its 14-conductor jumper cable. Set the TONE FREQ switch to 1785 -cycle position. Insert a lead into the PHONES jack on the front panel and touch the free end of the lead to the diversity control input " $A$ " on the Diversity Selector Unit (this point is marked " $A$ " in Figure 7-18 and is shown in Figure $7-45$ as terminal 8 of E905). Adjust the TONE LEVEL control, R629, to obtain an indication of 50 on the panel meter, M1601. Next move the free end of the lead to the diversity control input "B" on the Diversity Selector Unit (this point is marked "B" in Figure $7-18$ and is shown in Figure $7-45$ as terminal 22 of E901). The panel meter should indicate $50 \pm 20 \%$. If it does not, the circuits of the Diversity Selector Unit require checking and trouble shooting for faulty tubes or circuit components. Use the information (schematic diagrams, wiring diagrams, voltage and resistance measurements) given in Section 7.
b. Remove signal from jacks J1308 and J1309 and plug original cables in place.

## 3. LUBRICATION.

The only mechanism requiring lubrication is the rail system for sliding the main chassis into and out of the cabinet. Apply a light oil such as Military Symbol MS-2175 or specification MIL-L-15016 (Standard Navy Stock No. 14-0-2586 for a fivegallon can) when necessary.

## FAILURE REPORTS

AFAILURE REPORT must be filled out for the failure of any part of the equipment whether caused by defective or worn parts, improper operation, or external influences. It should be made on Failure Report, form NBS383, which has been designed to simplify this requirement. The card must be filled out and forwarded to BUSHIPS in the franked envelopt which is provided. Full instructions are to be found on each card.

Use great care in filling the card out to make certain it carries adequate information. For example, under "Circuit Symbol" use the proper circuit identification taken from the schematic drawings, such as T-803, in the case of a transformer, or R-207, for a resistor. Do not substitute brevity for clarity. Use the back of the card to completely describe the cause
of failure and attach an extra piece of paper if necessary.

The purpose of this report is to inform BUSHIPS of the cause and rate of failures. The information is used by the Bureau in the design of future equipment and in the maintenance of adequate supplies to keep the present equipment going. The cards you send in, together with those from hundreds of other ships, furnish a store of information permitting the Bureau to keep in touch with the performance of the equipment of your ship and all other ships of the Navy.

This report is not a requisition. You must request the replacement of parts through your Officer-in-Charge in the usual manner.

Make certain you have a supply of Failure Report cards and envelopes on board. They may be obtained from any Electronics Officer.

# SECTION 7 CORRECTIVE MAINTENANCE 

## WARNING

This equipment employs voltages which are dangerous and may be fatal if contacted. Always observe all safety regulations and precautions. Refer to the Safety Notices and high-voltage $W$ arning printed on pages viii and ix in the Front Matter of this instruction book.
The following procedures, together with the trouble-shooting charts in Tables 7-1 and 7-2, con-
stitute a systematic check of the functioning of the equipment. The overall circuits are first considered, after which information is given permitting to trace possible faults in individual units or sub-assemblies. Reference should be made also to the schematic and wiring diagrams and the tables of voltage and resistance measurements given at the end of this section. Adjustment procedures described in Section 3 will often be found useful in restoring proper operation of the equipment.

Figure 7-1. Frequency Shift Converter-Comparator Group AN/URA-6 or AN/URA-7, with Chassis Extended for Servicing

## 1. LOCALIZING TROUBLE.

a. FREQUENCY SHIFT CONVERTER, CV-57/URR, See Table 7-1.
(1) Check power (fuses good, pilot light on).
(2) If two lines appear on the tuning monitor while receiving frequency-shift signals, and can be made to merge by reducing the radio receiver gain to zero, the Input Unit and I-F Unit are operating.
(3) Press the CAL IN button. Two flickering lines on the tuning monitor indicate proper operation of circuits up to and including V601B in the Keyer.
(4) Plug a pair of headphones into the PHONES jack. A keyed tone signal will indicate the Keyer is operating, except for the output tubes, V607 and V608, which are checked in step 5 .
(5) Plug a $0-100$ ma milliammeter such as Navy Model OE series (connected to a phone plug with the tip to the "minus" and the shank to the "plus" terminal of the meter) into the TTYP jack on the front panel. A reading of about 60 ma on the milliammeter and a reading of 70 volts on a d-c voltmeter connected from jack to ground indicate the output tubes of the Keyer to be conducting but not keying.
(6) Replace the unit that the above tests have shown to be defective. Most troubles in any of the units can be located by replacing tubes as described in section 5 or by checking voltages and resistance values within that unit. Troubles in the Cable Filter Unit, Power Supply, or Tuning Monitor can best be located by continuity checks. See later paragraphs in this section, referring to the individual units.
b. FREQUENCY SHIFT CONVERTER-COMPARATOR GROUP AN/URA-6 or AN/URA-7.See Table 7-2.
(1) Check power of each unit (fuses good, pilot light on).
(2) Tune the two radio receivers to a frequency shift keyed signal. If two lines appear on each of the Tuning Monitors and can be made to merge by reducing the respective radio receiver gain to zero, the Input Units and I-F Units of the Converters are operating.
(3) Set the CHANNEL A LEVEL-DIV IND -CHANNEL B LEVEL first on CHANNEL A LEVEL and then on CHANNEL B LEVEL. Indication of similar levels shows the Diversity Selector Unit channel amplifiers and avc rectifiers, V901, V908, V902, and V909, to be functioning.
(4) Set the CHANNEL A LEVEL-DIV IND -CHANNEL B LEVEL switch to DIV IND. Change the CHANNEL A-COMBINED-CHANNEL B
switch firse to CHANNEL A, then to CHANNEL B. The meter should read 50 on the CHANNEL A position and 150 on CHANNEL B position, showing that the channel switching circuits are operating correctly.
(5) Plug a pair of phones in the PHONES jack of the Comparator. If a keyed tone is heard, the trouble is in the output tubes of the keyer or in the teletypewriter loop which are checked in step 7.
(6) Turn the Comparator SPEED switch to ADJ. If a keyed signal is heard, the trouble is in, or ahead of, the circuits of V601B of the Keyer.
(7) Plug a $0-100 \mathrm{ma}$ milliammeter such as Navy Model OE series (connected to a phone plug with the tip to the "minus" and the shank to the "plus" terminal of the meter) into the T'TYP jack on the front panel. A reading of about 60 ma on the milliammeter and a reading of about 70 volts on a d-c voltmeter connected from jack to ground indicate the output tubes of the Keyer to be conducting but not keying. A reading of approximately 30 ma indicates normal keying.
(8) Replace the defective unit (note that the Keyer Unit of the Frequency Shift Converters CV57/URR, CV-71/URR, and Comparator CM-14/URR are interchangeable) and shoot the trouble by checking tubes, voltages, and resistances, as shown in Tables 7-3 to 7-10 inclusive in another part of this section.

## 2. UNIT TROUBLE SHOOTING AND REPAIR.

a. EQUIPMENT REQUIRED. - The equipment for trouble shooting should consist of the following:
(1) A $\mathbf{2 0 , 0 0 0}$ ohms-per-volt multimeter such as Navy Model OE series or equivalent.
(2) An electronic multimeter such as Multimeter ME-25/U series, Navy Model OBQ series or equivalent.
(3) An oscilloscope, such as Oscilloscope OS$8 / \mathrm{U}$, Navy Models OBL or OBT series or equivalent.
(4) A microammeter such as Navy Type 60107.
(5) An adjustable r-f signal generator such as R-F Signal Generator Set AN/URM-25 series, Navy Model LP series or equivalent, with minimum range 25 to 500 kc and an impedance of approximately 70 ohms for testing of CV-57/URR and AN/URA-6 equipments or 910 ohms for testing of AN/URA-7 equipment (this impedance will have to be obtained by a matching network).
(6) A 14-conductor cable approximately 4 feet long with a 14 -prong plug on one end and a 14 -prong jack on the other end to match the connectors for the operating sub-assemblies.

TABLE 7-1. TROUBLE SHOOTING CHART, CONVERTER

ORIGINAL

TABLE 7-2. TROUBLE SHOOTING CHART, COMPARATOR

Figure 7-2. Cable Filters
(7) Use the equipment itself for servicing during non-operating periods. Where continuous operation is required, a separate maintenance system, comparable to the equipment in use, may be desirable.
(8) Tools normally used in the electronic technician's work will be satisfactory for this work.

## NOTES

1. Before attempting to remove the individual units controlled by panel knobs, pull the panel knobs outward to disengage the mechanical coupling. After the unit has been re-seated in the chassis, merely pushing the knobs will engage the mechanical couplers if the settings have not been dis-
turbed; otherwise it will be necessary to push and turn the knobs to engage the couplings.
2. Remove the chassis by unscrewing the rear screws and then the front screw. Replace units by tightening the front screw first and then the rear screws.
b. CABLE FILTERS.-See Figure 7-2. Check the circuits for continuity and shorts, using an ohmmeter. Trouble in the fan motor can best be remedied by replacing the motor or motor capacitor. See Figures 7-24 and 7-25 for the Converter Cable Filter schematic and wiring diagram and Figures $7-26$ and $7-27$ for the Comparator Cable Filter schematic and wiring diagram.

Figure 7-3. Converter Power Supply Chassis, Top View

Figure 7-4. Converter Power Supply Chassis, Botfom View

Figure 7-5. Comparator Power Supply Chassis, Top View

Figure 7-6. Comparator Power Supply Chassis, Boftom View
c. POWER SUPPLIES.-See Figures 7-3 to 7-6 inclusive. First check the resistance values as given in Table 7-8 for the Converter Power Supply and Table 7-9 for the Comparator Power Supply. Measure voltages only when the Power Supply is delivering normal load. The proper load voltages are indicated on the schematic and wiring diagrams, Figures 7-28 and 7-29, for the Converter Power Supply and Figures $7-30$ and $7-31$ for the Comparator Power Supply.
d. TUNING MONITOR.-See Figures 7-7 and 7-8. Circuit check (resistance and continuity) and tube replacement will locate troubles in the Tuning Monitor. See Table 7-7 for the resistance measurements. See Figure 7-32 and 7-33 for the schematic and wiring diagrams giving part locations and electrical values.

After the trouble has been corrected, the vertical centering for both positions of the CAL IN button must be adjusted with no signal input as follows.
(1) Depress the CAL IN button and adjust R705 so the sweep line coincides with the engraved center line on the Tuning Monitor window.
(2) Release CAL IN button and adjust the V CENT control so the horizontal sweep line coincides with the center line engraved on the Tuning Monitor window.

Figure 7-7. Tuning Monitor Chassis, Top View

After the centering is completed, adjust the FOCUS for the best average focus for the two CAL IN positions.

Figure 7-8. Tuning Monitor Chassis, Bottom View

# AN/URA-6, AN/URA <br> CV-57/UR 

Figure 7-9. Keyer Chassis, Top View
e. INPUT UNIT.-See Figures 7-11 and 7-12. Check the tubes, then circuit-check the unit for shorts, open circuits, or off-value parts (see Figures $7-34,7-35,7-38,7-39$, and Tables $7-3$ and 7-4). If the trouble is not located, use the following procedure.
(1) Apply a 400-kc signal (for CV-57/URR or AN/URA-6 equipments) or a $50-\mathrm{kc}$ signal (for AN/URA-7 equipment) of about 0.01 volt to the i-f input, pin 8 of plug P101 or P201 as the case may be. Set the NARROW-WIDE switch to NARROW. Connect an external test oscilloscope to the plate pin 5 of converter tube V103 or V203. If no signal is observed, check for incoming signal on pin 7 or local-oscillator input on pin 1. Absence of signal in either case indicates direction of trouble:
(2) If no signal appears on pin 7 of V103 (or V203), check the circuit by connecting test oscilloscope to terminal D of transformers T102 (or T202) and T103 (or T203) in that order.
(3) If no signal appears on pin 1 of V103 (or V203), remove tube V103 (or V203) from its socket. If signal then appears, the trouble is in the AFC circuits.
f. I-F UNIT.-See Figures 7-13 and 7-14. Check the tubes, then circuit-check the unit for shorts, open circuits, or off-value parts (see Figures 7-36, 7-37, and Table 7-5). If the trouble is not located, use the following procedure.

Figure 7-10. Keyer Chassis, Boffom View
(1) Apply a $40-\mathrm{kc}$ signal of about one volt pin 10 of plug P301 or, if the Input Unit is know to be in operating order, apply a signal to the IINPUT jack J1111 (400 kc for CV-57/URR AN/URA-6 equipment, 50 kc for AN/URAequipment). Place switch S301 in WIDE positio
(2) With the test oscilloscope, check for pre ence of signal successively at V302 pin 1, V301 pin V301 pin 1, T301 terminal D. Absence of signal a one of these points indicates trouble in the relate circuit.
(3) Place switch S302 in TUNE position. Cor nect a VoltOhmyst or equivalent indicating meter pin 7 of V303. Vary the input-signal frequency. Th meter should trace out the discriminator curv Changing the input-signal level between 2500 micr volts and 0.5 volt should not change the discriminatc curve amplitude.
g. KEYER UNIT.-See Figures 7-9 and 7-1 Check the tubes then circuit check the unit fo shorts, open circuits or off value parts (see Figur 7-42, 7-43 and Table 7-6). Switch S604 (on th rear bracket) must be in the ON position for th teletypewriter to operate. The switch, in the OF position, opens the screen grid circuit of the outpy tubes when the Keyer is not connected to a tel typewriter.

Figure 7-11. Input Unit, Top View

Figure 7-12. Input Unit, Botfom View

Figure 7-1 3. I-F Unit, Top View

figure 7-14. I-F Unit, Boftom View

g

Connect a 0.5 -volt source of 60 -cycle sine-wave voltage to P601-14 or E609 and ground. Proceed from stage to stage, using the test oscilloscope as an indicator (see Figures 7-9 and 7-10).
(1) Connect the test oscilloscope to pin 1 of V601 before turning on the power. Turn on the power and adjust the test oscilloscope to 30 cycles sweep frequency, giving a pattern with two complete cycles. A signal indicates that the $1,2,3$ triode of V601 is working satisfactorily. Turn off power and remove oscilloscope leads.
(2) Connect the test oscilloscope to pin 7 of V601. Turn on the power and check the three positions of S601, the SPEED switch. Low and HIGH positions should give the same amplitude, but the ADJ position may give a different amplitude since the signal will be coming from a different source. Return S601 to its original position. This checks the signal to the grid, pin 7, of V601B.
(3) Connect the test oscilloscope to E610. A signal with the same shape but increased amplitude, compared to step (2), should be obtained.
(4) With the power turned off, connect the test oscilloscope input to the indicated pins of tubes V603 and V604 in the order $2,7,1,6$. Turning on the power, a square wave should be obtained in all cases with the NORM-REV switch in either position. If the signal is anything but a square wave, check the values of parts in the circuits of the tubes V603 and V604.
(5) Turn off power, connect the test oscilloscope to either pin 1 or 7 of first V607, and then V608, turning on the power every time. If the square-wave keying signal is obtained, turn the power off and change the test oscilloscope lead to pin 5 of V607. Turn the power on, and if no signal is obtained the trouble is in the output circuits of the keyer tubes V607 and V608.
(6) Connect the test oscilloscope to the center contact of the TONE LEVEL control R629 or pin 7 of V605 to check the Tone Oscillator operation. Further check of tube V605 can be had by connecting the test oscilloscope (with the power turned off) to pin 6 of V605 and then across the output (terminals 3 and 4) of T601.
b. DIVERSITY SELECTOR UNIT.-See Figures 7-17, and 7-18. Check tubes, then circuit check the unit for shorts, open circuits or off-value parts (see Figures 7-44, 7-45 and Table 7-10).

Apply an adjustable 400-kc (for CV-57/URR or AN/URA-6) or $50-\mathrm{kc}$ (for AN/URA-7) sinc-wave voltage ( 0.5 volt maximum) to pins 9 and 14 on
plug P901. Check to make sure the connector links O901 and O902 are set to the I-F position.
(1) Connect the microammeter first to pin 12 of P901, and adjust a-c voltage to give a 50 -microampere reading. Change meter to pin 11 of P 901. The reading should also be about 50 microamperes. If these readings are obtained the channel amplifier and avc rectifier circuits are satisfactory. Continue with step (3). If not satisfactory, continue with step (2).
(2) If no indication is obtained in step (1), connect a test oscilloscope first to pin 1 and then to pin 5 of each of the two input tubes V901 and V908. A sine wave should appear at each point indicated, but the amplitude of the signal at pin 5 should be greater than at pin 1. Turn the power off before contacting pin 5. If a signal is on pin 5 check the circuits of V902 and V909 pins 1 and 7 each.
(3) Connect an electronic voltmeter between O901 and ground (see Figure 7-18). A d-c voltage should be observed whose polarity will depend on which channel is conducting (posicive when channel $A$ is conducting, negative when channel $B$ is conducting).
(4) Turn off power. With switch S901 on COMBINED (center position) connect pin 6 of V903 to one side (pin 4) of filament. Connect test oscilloscope to pin 6 of V903. Turn on the power and observe signal amplitude. Turn off power, connect test oscilloscope to pin 1 of V903. Turn on power. If signal amplitude is smaller, trouble is in V903 circuit. If signal amplitude is greater proceed with step (5).
(5) Connect the test oscilloscope (with the power turned off) to pins 2,7,1 and 6 of tubes V904 and V905. At all points a square-wave signal should be obtained; if not, check circuit values and voltages for the trouble.
(6) Connect the test oscilloscope to pin 7 of V906 and then to pin 7 of V907. A square-wave signal should be on each grid and cathode, pin 8. A similar signal should appear on the plate, pin 1 of V906 and V907.
(7) Any further trouble would be in the signal input and output circuits and may be readily located by circuit check. See the Schematic Diagram, Figure 7-44.
(8) Remove test lead from pin 6 of V903.
i. RECEIVER COUPLING KIT 10563. - Check the tube, then circuit-check for shorts, open circuits, or off-value parts (see Figures 7-40 and 7-41).

## 3. VOLTAGE AND RESISTANCE MEASUREMENTS.

The following Tables 7-3 to $7-10$ inclusive show voltage and resistance measurements made on the equipment under the following conditions:

1. TUNE-OPERATE control in TUNE position.
2. NARROW-WIDE control in WIDE position.
3. TONE FREQ control at 595 position.
4. TONE LEVEL control at 10 position.
5. SPEED control at LOW position.
6. NORM-REV control in NORM position.
7. VERT GAIN control at maximum clockwise postion.
8. FOCUS control in normal operating position.
9. THRESHOLD control at 0 .
10. INTENSITY control in normal operating position.
11. Teletypewriter out, Keyer Unit toggle switch S604 in OFF position.

Figure 7-1 8. Diversity Selector Unit Chassis, Bottom View
12. On Comparator CM-14/URR, CHANNEL A -COMBINED-CHANNEL B control and CHANNEL A-DIV IND-CHANNEL B control set to CHANNEL A position.
13. Units assembled in chassis for voltage measurements to chassis ground.
14. Units removed from chassis for resistance measurements to chassis ground.
15. No signal input.
16. Voltage readings taken with a 20,000 ohms per volt multimeter Model OE series or equivalent.

## WARNING

This equipment employs voltages which are dangerous and may be fatal if contacted. Always observe all safety regulations and precautions. Refer to the Safety Notices and high-voltage Warning printed on pages viii and ix in the Front Matter of this instruction book.

## SCHEMATICS FOR WINDING DATA

Complete repair of the filter assemblies is an intricate factory procedure and is not described here. In addition to values of components shown on schematic diagrams, refer to the filter characteristics given in the following paragraphs of Section 2:

| Filter Symbol | Paragraph |
| :---: | :---: |
| Z601 | 7 |
| Z1101 | 4 |
| Z1102 | 4 |
| Z1301 | 12 |
| Z1302 | 12 |

In the adjoining schematic diagrams inductance values are in henrys, capacitance values in microfarads, and resistance values in ohms.
