1. GENERAL

1.01 This section provides the installation and checkout procedure for the DATASPEED Tape Receivers 5B, 5B-1, 5B-2, and 5B-3. It is reissued to add information on interconnections with apparatus unit options and on the location and removal of wiring options. Since there are many changes, marginal arrows ordinarily used to indicate changes and additions are omitted.

1.02 Description, trouble shooting, adjustments and lubrication, as well as information on apparatus unit options, can be found in the appropriate sections.

1.03 The 5B-1, 5B-2, and 5B-3 Receivers are the same as the 5B Receiver except that they have the following apparatus unit options:
   • The 5B-1 has a TP199784 identifier.
   • The 5B-2 has a TP199788 unattended send-receive unit.
   • The 5B-3 has a TP199758 unattended send-receive unit and a TP199784 identifier.

1.04 Tables 1, 2, and 3 indicate the various types of operation available with the Receiver as well as providing information on equipment required, wiring options, and stripping plugs. The 5A-1 and 5C-1 Senders of Table 3 are the same as the basic senders 5A and 5C except that they have a TP198002 recognizer apparatus unit option. Figure 1 provides interconnecting information.

2. INSTALLATION

LOCATION

2.01 In choosing a site for the Tape Receiver, consider the following:

(a) The cabinet is 16 inches wide, 24-3/8 inches deep, and 54-1/4 inches high. Sufficient space should be provided at the front of the cabinet to permit the door covering the lower half of the cabinet to be swung open. Allow 3 inches ventilation and access space at the rear of the cabinet. The Receiver Set weighs 196 pounds.

(b) The cabinet should be placed near a 3-wire grounding, 115 volt ac receptacle. The receptacle should be separately fused to preclude unnecessary interruptions in service, and must be capable of supplying a peak current of 10 amps.

UNPACKING INFORMATION

2.02 The unpacking procedure appears on a label affixed to the shipping carton. Refer to those instructions when unpacking the unit.
LEGEND:  
J - CONNECTOR ATTACHED TO EQUIPMENT  
P - STRAPPING PLUG OR CONNECTOR ATTACHED TO A CABLE  
** - REPRESENTS MULTIPLE CONNECTOR IN DRAWING  
--- - AREA PERTINENT TO RECEIVER  
IS OUTLINED BY BROKEN LINE  
*402A CAN BE USED WITH MANUAL SEND STATION ONLY
2.03 Three immobilizing brackets (Figure 2) are used to secure the tape punch and its mounting frame during shipment. Remove the cabinet back panel to gain access to the TP147569 bracket. Remove this bracket, slide the punch assembly forward and remove the remaining two brackets.

2.04 Remove shipping tape from the DRPE cover and the tape sensing arm.

INSTALLING DATA SET

A. Receive-Only Station

2.05 A shelf located near the center of the cabinet accommodates the data auxiliary set 804A. The companion data set 402D is to be mounted at the bottom of the cabinet. The installation procedure is given in the paragraphs following. Refer also to Table 3 and the cabling diagram 6448WD ("Schematic and Actual Wiring Diagrams" section), and to the instruction material supplied with the data set.

(1) Place the unit in an area allowing clear access to the front and rear. Remove the rear panel first loosening the single captive screw at the top.

(2) Open the cabinet door by pulling on the upper left hand corner and pull the receiver module forward as far as it will go. Lift the front of the module to clear the cabinet stop, remove the module and place it on the floor. It is not necessary to disconnect the cables. Similarly remove the accessories mounting frame.

(3) Loosen the four captive screws which secure the shelf at the bottom of the cabinet, and remove the shelf.

(4) Place the data set in the bottom of the cabinet. Tilt the 402D data set slightly and make connections between the data set, electrical service panel and Receiver module. Replace the bottom shelf, the Receiver module, and the accessories frame.
5) Mount a 44A telephone terminal block backboard, and terminal board on the electrical service panel at the rear of the cabinet if required. Two mounting holes on the left side of the cabinet (looking from the rear) are provided. (Refer to the data set instruction material for the type of terminal block required.)

6) Remove the three screws that secure the panel at the center of the cabinet, remove the panel and place the data auxiliary set 804A on the shelf provided. Replace the panel.

7) Make connections between the data set, data auxiliary set and telephone terminal block and connector block as shown in Figure 3. Refer to the instruction material supplied with the data set when choosing or wiring the connector block.

8) Replace rear cabinet cover.

B. Send-Receive Station

2.06 When installing a Tape Receiver as part of a send-receive station (i.e., a Sender and Receiver at the same site sharing a common telephone line) the data auxiliary set 804A is not required. An optional TP199633 blank panel is available to replace the two panels which normally mount the data auxiliary set. Figures 1 and 3 reflect the wiring changes for send-receive operation.

OPTIONS (Tables 1, 2 and 3)

2.07 Early design 5B Receivers are wired for 8-level operation. These Receivers require the addition of straps for 5-, 6- or 7-level operation. Late design Receivers have three switches on the front panel to select or omit levels numbered 8, 7 and 1 (from left to right) respectively. Add straps or position switches for the various levels as indicated below.

(a) 8 Level - No straps or all switches positioned up in PUNCH LEVEL SELECTION position.

(b) 7 Level - Add strap between pins 1 and 24 on XZ111 (see 6403WD and 6404WD in Wiring Diagram section) or position 8-level switch down to OMIT position.

(c) 6 Level - Add straps between pins 1 and 24 on XZ111 and on XZ110 or position 8 and 7 level switches down to OMIT positions (6403WD and 6404WD).

(d) 5 Level - Add straps between pins 1 and 24 on XZ111, XZ110 and XZ104 or position level switches 8, 7 and 1 down to OMIT positions (6403WD and 6404WD).
2.08 Locate the accessory strapping plug con-
nected to J104 on the Receiver module. With-
draw the plug and remove the plug cover. If the sta-
tion is not to be used on a receive-only rotary
hunting line, grasp pin 23 of the plug with a
long nose pliers and pull it out of the connector
body. Tape the bare pin. Similarly pull out, and
tape pin 15 if automatic answering is to be per-
manently disabled. Replace the accessory plug.

2.09 A set of contacts is provided on the Re-
ciever module (TB104) which can be con-
nected to an external signaling device to advise
the operator of an incoming call.

3. CHECKOUT PROCEDURES

PRELIMINARY INSPECTION

Note: The following tests do not require
operation of the equipment on line.

3.01 Connect the Receiver power cord to the
ac outlet. Press the power switch to turn
the power on. The power switch should be il-
luminated and should flash on and off, indicating
a low tape condition.

3.02 Load and thread tape through the punch
as explained in the related "Description
and Operation" section. The power switch
should now be continuously illuminated.

3.03 Press the BLANKS FEED OUT button and observe that
the tape is fed out unperforated (except for feed holes). Press the
LETTERS FEED OUT button and observe that
the tape is perforated at all levels.

3.04 Check the perforation spacing with a
tape gauge. Perforations should be
spaced correctly and form a straight line par-
allel to the edges of the tape. (Refer to section
on DRPE type "High Speed Tape Punch Adjust-
ments", if required).

3.05 Remove the tape supply spool if neces-
sary, to allow the tape sensing arm to
drop. Observe that the LOW TAPE lamp lights
as the arm swings toward the hub. The low
tape switch is factory adjusted to indicate a low
tape condition when the tape supply drops below
about 150 feet. The switch may be readily ad-
justed (refer to related "Adjustments, Lubrica-
tion, and Disassembly" section) to suit the re-
quirements of the customer.

SIGNAL LINE HOOKUP

3.06 Make connection between the data set and
telephone line in accordance with the in-
tuctions supplied with the data set. The ter-
minal board mounted on the electrical service
panel at the rear of Receiver (Par. 2.05) is pro-
vided expressly for this purpose. Perform
whatever tests are called for in the data set
literature.

TEST CENTER TESTS

3.07 Make use of the system test centers
(where available) to make final test of
the system.
TABLE 1
SERVICE ARRANGEMENTS

The following table summarizes the apparatus required for various types of service arrangements. The use of suffixes in the coding scheme permits initial ordering of the arrangements needed. The addition of apparatus unit options to existing standard equipments can provide the same arrangements.

<table>
<thead>
<tr>
<th>SERVICE</th>
<th>SENDER APPARATUS STATION 1</th>
<th>RECEIVER APPARATUS STATION 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attended at both stations</td>
<td>5A or 5C Sender data set 402C or 402A</td>
<td>5B Receiver data set 402D and data auxiliary set 804A</td>
</tr>
<tr>
<td>Sender attended</td>
<td>5A or 5C Sender data set 402C or 402A</td>
<td>5B Receiver - use auto answer feature in data set 402D and data auxiliary set 804A</td>
</tr>
<tr>
<td>Receiver unattended</td>
<td>5A-1 or 5C-1 Sender - use auto answer feature in data set 402C</td>
<td>5B-1 Receiver data set 402D and data auxiliary set 804A</td>
</tr>
<tr>
<td>Unattended send-receive stations</td>
<td>5A-1 or 5C-1 Sender - use auto answer feature in data set 402C</td>
<td>5B-2 Receiver - use auto answer and send-receive features in data set 402D</td>
</tr>
<tr>
<td>Unattended send-receive stations Receiver in manual condition and capable of calling unattended Sender</td>
<td>5A-1 or 5C-1 Sender - use auto answer feature in data set 402C</td>
<td>5B-3 Receiver - use auto answer and send-receive features in data set 402D</td>
</tr>
</tbody>
</table>

For the table-mounted sender, the TP198002 recognizer option for discrete calling and unattended service mounts beside the other apparatus units in the wall mounted apparatus box. For the floor mounted Sender, this unattended service apparatus unit option is mounted in a space provided in the equipment cabinet.

Unattended Send/Receive Station

This station consists of a Sender arranged for unattended service and a Receiver containing an unattended send/receive apparatus unit option (TP199788). The send/receive station will automatically arrange itself to send or receive as appropriate to the type of calling station. A send/receive station used in placing a call can be manually switched to function as a sender or as a receiver; and a remote unattended send/receive station will follow these switching operations.

Note: Refer to text paragraphs covering options.
